Self-Locking Flat Head Phillips

With a nylon locking patch bonded to the threads, these screws won't vibrate loose. The nylon patch has a temperature range of −70° to +250° F. All screws are beveled under the head to provide a flush surface within countersunk holes. They're made from 18-8 stainless steel, are fully threaded, and have a Class 2A thread fit. Length is measured from the top of the head.

Military Specification Stainless Steel Flat Head Phillips

Designed to meet stringent military specifications, these screws provide a flush surface within countersunk holes. They're fully threaded with a Class 2A thread fit and made from 300 series stainless steel. Minimum tensile strength is 80,000 psi. Not rated for Rockwell hardness. Materials and dimensions meet Fed. Spec. FF-S-92. Length is measured from the top of the head.

82° screws meet MS 51959 (except for sizes marked with a ♠, which meet MS 51960). Screws marked with a ● have an undercut head to allow more threading. All are passivated (treated with nitric acid to create a film that protects against oxidation and corrosion) to meet QQ-P-35.

100° screws have a larger bearing surface to distribute holding force, so they're preferred over 82° flat heads for use in soft materials. They meet MS 24693 (except for sizes marked with a ★, which meet National Aerospace Standard 662C). All are passivated (treated with nitric acid to create a film that protects against oxidation and corrosion) to meet ASTM A380.

Sealing Flat Head Phillips

Seal out air, water, lubricants, and other contaminants with these reusable, vibration-resistant screws. Each screw has a silicone rubber O-ring attached to a groove under the head. The O-ring stops pressure up to 6000 psi (when used in the hole size range listed) and withstands temperatures from –150° to +500° F.

Screws are beveled under the head to provide a flush surface within countersunk holes. Angle of bevel is 100°, unless noted. All screws are made from 18-8 stainless steel. They're fully threaded and have a Class 2A thread fit. UL recognized. Length is measured from the top of the head.

■ Angle of bevel is 82°.

Metric Flat Head Phillips

Our metric-sized flat head screws have a 90° bevel under the head to provide a flush surface within countersunk holes. All are fully threaded and have a Class 6g thread fit, except *black-oxide 18-8 stainless steel* and *zinc-plated steel* screws, which have a Class 6h thread fit. Screws meet DIN 965. Length is measured from the top of the head.

Black-oxide 18-8 stainless steel is not rated for Rockwell hardness.

Flat Head Slotted

Flat head screws are beveled under the head to provide a flush surface within countersunk holes. Screws up to 2″ long are fully threaded; those longer than 2″ have at least 1½″ of thread. Screws marked with a ● have an undercut head to allow more threading. All have a Class 2A thread fit. Length is measured from the top of the head.

Type 316 Stainless Steel

1280-Piece Assortment

Metric Flat Head Slotted

Offered in metric sizes, these flat head screws have a 90° bevel under the head to provide a flush surface within countersunk holes. All are fully threaded and have a Class 6g thread fit, except *zinc-plated steel* screws, which have a Class 6h thread fit. Screws meet DIN 963. Length is measured from the top of the head.

Flat Head Torx

Made from zinc-plated steel, these flat head screws have a Torx drive that reduces slipping and improves driving power. They're beveled under the head to provide a flush surface within countersunk holes and have a Class 2A thread fit. Screws up to 2″ long are fully threaded; those longer than 2″ have at least 1½″ of thread. Length is measured from the top of the head.

Machine Screw Assortments with Nuts and Washers

Machine Screws, Sheet Metal Screws, Nuts, and Washers

18-8 SS

Our 1500 piece 18-8 stainless steel and zinc-plated steel assortments contain flat and pan head Phillips sheet metal and machine screws, plus a variety of nuts and washers. Each includes 600 No. 6, 8, and 10 size sheet metal screws in lengths from ⅜″-1½″; 150 size 10-24 and ¼″-20 machine screws in lengths from ¾″-1″; 250 size 6-32, 8-32, 10-24, ¼″-20, 5⁄16″-18, and ⅜″-16 nuts; and 500 No. 6, 8, 10, ¼″, 5⁄16″, and ⅜″ size lock washers and flat washers.

The ***18-8 stainless steel assortment*** also includes 50 size 10-32 machine screw nuts for a total of 1550 pieces. Comes in an 18⅜″ Lg. × 12¼″ Wd. × 3⅛″ Dp. metal box with lid chart.

90970A350 ..... **Each** $142.60

The ***zinc-plated steel assortment*** comes in a 13″ Lg. × 9″ Wd. × 2¼″ Dp. clear plastic box with lid chart.

90970A670 ..... **Each** $112.00

Assorted Screws, Nuts, Washers, and Electrical Terminals

This 3342 piece assortment includes 480 round head slotted machine screws in sizes 6-32, 8-32, 10-24, and ¼″-20 in lengths from ½″-1½″, plus 490 nuts, 490 lock washers, and 490 flat washers in the same sizes; 700 No. 4, 6, 8, 10, and 14 size pan head combination drive tapping screws in lengths from ½″-1½″; 500 No. 4, 6, and 8 size flat head slotted wood screws in lengths from ½″-1″; 55 size 6-32, 8-32, 10-24, 10-32, ¼″-20, ¼″-28, 5⁄16″-18, 5⁄16″-24, ⅜″-16, ½″-13, and ⅝″-11 socket head screws in lengths from ⅛″-⅝″; 37 size 8-32, 10-24, 10-32, ¼″-20, 5⁄16″-18, and ⅜″-16 socket head cap screws in lengths from ½″-2″; and 100 electrical terminals including ring, spade, and butt connectors.

All are made from zinc-plated steel (except socket screws which have a black-oxide finish) and come furnished with a 14¾″ Lg. × 6¼″ Wd. × 18½″ Ht. plastic storage cabinet.

92250A680 ..... **Each** $190.92

Machine Screws, Nuts, and Washers

We've pulled together two great assortments of 18-8 stainless steel screws, nuts, and washers in your choice of inch and metric sizes.

The ***inch assortment*** contains 1440 pieces and includes 360 size 4-40, 6-32, 8-32, 10-24, 10-32, and ¼″-20 pan head Phillips, and pan, flat, and round head slotted screws in lengths from ¼″-1½″, plus 360 nuts and 360 split-lock washers and flat washers in the same sizes. All come in an 18½″ Lg. × 15″ Wd. × 6½″ Dp. plastic cabinet with 39 drawers.

94852A430 ..... **Each** $233.00

The ***metric assortment*** contains 2200 pieces and includes 600 M3 and M4 pan and flat head Phillips screws in lengths from 6-16 mm, plus 600 nuts, and 1000 split-lock washers and flat washers in sizes M3, M4, M5, M6, M8, and M10. All come furnished in an 18½″ Lg. × 12″ Wd. × 3″ Dp. compartmented metal box with a lid chart.

91470A150 ..... **Each** $190.76

Oval Head

Oval head screws are beveled under the head like flat head screws, but have a decorative, rounded top. Designed to be used in countersunk holes; length is measured from the edge of the head.

Inch sizes have an 82° beveled head and a Class 2A thread fit. ***Metric*** sizes have a 90° beveled head and a Class 6g thread fit.

Screws up to 2″ long are fully threaded; those longer than 2″ have at least 1½″ of thread. Sizes marked with a ● have an undercut head to allow for more threading.

Tamper-Resistant

To discourage tampering, these screws require unique drivers. All are made from 18-8 stainless steel except tri-groove screws, which are made from zinc-plated, case-hardened steel. Each has a class 2A thread fit (unless noted). Screws up to 2″ long are fully threaded; those longer than 2″ have at least 1½″ of thread. Flat head screws provide a flush surface within countersunk holes.

Drilled Spanner— For drivers, see 94062A on page 2835; for bits, see 52775A on page 2825. Not rated for Rockwell hardness.

One-Way— Install with a slotted screwdriver. For removal tools, see 7392A on page 2835.

Pin-in-Torx— L-keys and drivers are sold on page 2849; bits are sold on page 2824.

Tri-Groove— For sockets and drivers, see 7393A on page 2835.

Also Available: One-way screws made from zinc-plated steel. Please ask for 90287A660 and specify thread size and screw length.

● Head is undercut to allow more threading. ★ Class 3A thread fit.

Very High Temperature Hex Head

These ceramic screws won't melt, rust, seize, or become brittle—even at temperatures up to 3000° F. They have a 99.8% alumina content, are highly resistant to corrosive gases, and are nonconductive. Color is off-white. Hardness is 1365 on the Vickers scale. Screws are fully threaded and have a nominal Class 2A thread fit. Length is measured from under the head. Matching nuts sold separately below.

Nylon Machine Screws

Pan Slotted | Round Slotted | Binding Slotted | Fillister Slotted | Hex | Flat Slotted

Our economical, off-white nylon 6/6 screws are fully threaded, nonconductive, and resistant to chemicals and solvents (except mineral acids). Temp. range is –40° to +185° F. (*Note:* Nylon absorbs moisture which can affect dimensions and other properties.) Not rated for hardness or tensile strength. All but hex heads have a slotted drive. Pan, round, binding, fillister, and hex head screw length is measured from under the head. Flat head screw length is measured from the top of the head.

100° and 82° flat head screws provide a flush surface within countersunk holes. 100° flat head screws have a larger bearing surface so they're preferred over 82° flat heads for use in soft materials.

To Order: Please specify pan, round, binding, fillister, hex, 100° flat, or 82° flat head style.

Also Available: Black nylon screws. Please ask for 94735A666 for Pan Head; 97263A110 for Round Head; 95000A555 for Binding Head; 93939A880 for Fillister Head; 99091A330 for Hex Head; 98286A220 for 100° Flat Head; and 95133A777 for 82° Flat Head; then specify thread size and length.

Metric Nylon Machine Screws

Pan Phillips | Pan Slotted | Cheese Slotted | Flat Slotted

Fully threaded, nonconductive, and made from off-white nylon 6/6, these screws are resistant to chemicals and solvents (except mineral acids) and have a temperature range of –40° to +185° F. (*Note:* Nylon absorbs moisture which can affect dimensions and properties.) Not rated for hardness or tensile strength. Pan head screws come with your choice of Phillips and slotted drive. Cheese and flat head screws have a slotted drive. Pan and cheese head screw length is measured from under the head. Flat head screw length is measured from the top of the head.

Pan head Phillips screws in sizes M2-M5 have a #1 drive; size M6 have a #2 drive; and size M8 have a #3 drive.

Cheese head screws combine the greatest head height with the smallest head diameter for maximum driving power.

Flat head screws are beveled 90° (unless noted) under the head to provide a flush surface within countersunk holes.

To Order: Please specify pan, cheese, or flat head style. For pan head screws, also specify Phillips or slotted drive.

Also Available: Black nylon screws. Please ask for 92492A560 for Pan Head Phillips; 90451A450 for Pan Head Slotted; 96295A890 for Cheese Head Slotted; and 95258A670 for Flat Head Slotted; then specify thread size and length.

Polycarbonate, PTFE, and PEEK Machine Screws

Pan Phillips | Pan Slotted | Round Slotted | Hex | Flat Slotted

Choose these screws to handle extreme conditions. They're fully threaded and nonconductive. Not rated for hardness or tensile strength. Pan and hex head screw length is measured from under the head. Flat head screw length is measured from the top of the head. Flat head screws are beveled 82° under the head to provide a flush surface within countersunk holes.

Polycarbonate— A tough material with extreme impact resistance. Does not absorb moisture. Temperature range is –40° to +212° F. Color is clear.

PTFE— Unaffected by grease, oil, detergents, and most mineral acids. Has excellent nonstick properties. Temperature range is –450° to +500° F. Color is white.

PEEK— Extremely stable in hostile environments; withstands water and steam without loss of physical properties. Maximum temperature is 500° F. Color is tan.

To Order: Polycarbonate and PEEK screws, please specify pan head Phillips or flat head slotted style.

To Order: PTFE screws, please specify pan head slotted, hex head, or flat head slotted style.

Also Available: PTFE round head slotted screws. Please ask for 94700A910 and specify thread size and screw length.

About Set Screws, Materials, and Hex Sizes

Unlike typical screws that hold materials together by way of threads, set screws are designed to exert pressure at the tip to hold objects in place.

Point Selection

Cup Point—The most popular set screw style, the cup has a thin edge that digs into the contact surface for high holding power.

Extended Point—Have a protruding tip that locks within mating holes or slots in your workpiece. Often used in place of a dowel pin.

Knurled Cup Point—A variation of the cup point, this style has knurls that improve grip and prevent the screw from backing out or loosening from vibration.

Cone Point—With the highest holding power of any style set screw, cone points feature a sharp tip that wedges into the contact surface.

Flat Point—Best for making frequent adjustments, the blunt tip won't mar the contact surface.

Oval Point—Like flat points, these are ideal for making frequent adjustments. Their rounded tip has a small contact area and causes little damage.

Materials

Stainless Steel—*Type 316 stainless steel* and *18-8 stainless steel* may be mildly magnetic and have a minimum Rockwell hardness of B80 (unless noted). Type 316 stainless steel provides better corrosion resistance than 18-8 stainless steel and also contains molybdenum, which increases corrosion resistance to chlorides and sulfates.

Alloy Steel—Heat-treated for hardness with a minimum Rockwell hardness of C45 (unless noted).

Brass—Corrosion resistant and usually softer than stainless steel and steel. Generally nonmagnetic. Minimum Rockwell hardness is B55.

Nylon 6/6—Is nonconductive and resistant to chemicals and solvents (except mineral acids). It does absorb moisture, which can affect dimensions and other properties. Color is off-white. Withstands temperatures from –40° to +185°F (unless noted). Not rated for hardness.

Nickel Alloy C276—This high-strength alloy withstands most corrosive environments and resists stress-corrosion cracking and oxidation. Nonmagnetic. Not rated for hardness.

Nickel Alloy 400—Has excellent corrosion resistance—even in marine and chemical processing environments. It's strong, heat resistant, and slightly magnetic. Not rated for hardness.

Finish

Cadmium Plated—Adds rust resistance and lubricity.

Cup Point Set Screws

The most common point style, cup points have a thin edge that digs into the contact surface for high holding power. All have a hex socket and a Class 3A thread fit. Dimensions meet ASME B18.3. Length listed is the overall length.

★ Hex size is 0.035".

(Continued on following page)

Cup Point Set Screws *(Continued from previous page)*

The most common point style, cup points have a thin edge that digs into the contact surface for high holding power. All have a hex socket and a Class 3A thread fit. Dimensions meet ASME B18.3. Length listed is the overall length.

Self-Locking Cup Point Set Screws

Upgraded with a nylon locking element, our self-locking hex-socket set screws are perfect for tough jobs. The locking element increases holding power and remains effective up to 250°F. All screws have a locking patch, except those marked with a ●, which have a locking pellet. Screws are reusable and have a Class 3A thread fit. Dimensions meet ASME B18.3. Length listed is the overall length.

18-8 stainless steel screws have a minimum Rockwell hardness of B80. ***Alloy steel*** screws have a minimum Rockwell hardness of C45, except for those with a locking pellet, which have a minimum Rockwell hardness of C28.

92560A222 ..... Each $93.25

For information about point selection, materials, and hex key sizes, see page 3072.

Metric Cup Point Set Screws

These metric-sized set screws have a thin edge that digs into the contact surface to provide high holding power. Screws have a hex socket and meet DIN 916/ISO 4029. Stainless steel screws have a Class 6g thread fit; black alloy steel screws have a Class 5g6g thread fit. Length listed is the overall length.

Fine thread black alloy steel screws have a finer thread pitch than other cup point set screws.

Cup Point Slotted Set Screws

Also known as headless set screws and grub screws, these slotted set screws install with a standard slotted screwdriver. The edge of the cup point digs into the contact surface for maximum holding power. Screws have a Class 2A thread fit. Dimensions meet ASME B18.6.2. Length listed is the overall length.

Military Specification Cup Point Set Screws

Designed to meet stringent military specifications, these set screws have a hex socket and a Class 3A thread fit. Length listed is the overall length.

18-8 stainless steel screws are passivated (treated with nitric acid to create a film that protects against oxidation and corrosion) to meet QQ-P-35. Not rated for hardness.

Cadmium-plated alloy steel screws have a minimum Rockwell hardness of C45. The plating adds rust resistance and lubricity.

High Performance Nickel Alloy Cup Point Set Screws

Our nickel alloy hex socket set screws maintain their high strength under the most extreme conditions. To maximize holding power, the edge of the cup point digs into the contact material. All screws have a Class 3A thread fit and are not rated for hardness. Dimensions meet ASME B18.3. Length listed is the overall length.

Alloy 400 is highly resistant to corrosion and heat.

Alloy C276 offers outstanding resistance to chemical corrosion and stress-corrosion cracking.

Self-Locking Extended Point

Extra-Long Extended Point

Also known as dog point and pilot point set screws, these hex socket screws have an extended tip that guides them into mating holes or slots in your workpiece. They permanently lock one object to another and are frequently used to secure parts to rotating shafts so the entire assembly turns in unison. Length listed is the overall length.

Inch size *extended point* and *self-locking extended point* set screws made of black alloy steel meet ASME B18.3. *Extra-long extended point* screws have a point that's twice as long as that of extended point set screws. *Self-locking extended point* screws have a nylon patch on the threads that locks them in place and prevents loosening from vibration. The patch retains its strength at temperatures up to 250°F. All inch screws have a Class 3A thread fit.

Metric sizes meet DIN 915/ISO 4028. 18-8 stainless steel metric screws have a Class 6g thread fit; black alloy steel metric screws have a Class 5g6g thread fit.

For extended point thumb screws, see page 3092.

Knurled Cup Point Set Screws

Similar to cup point set screws, but these screws have knurls that improve grip and prevent them from backing out or loosening from vibration. All have a hex socket. Length listed is the overall length.

Inch sizes have a Class 3A thread fit; screw dimensions meet ASME B18.3. Metric sizes have a Class 6g thread fit.

Cone Point Set Screws

Designed to provide the highest holding power of any style set screw, these hex socket screws have a sharp conical point that wedges into the contact surface. They work especially well against hardened surfaces.

The point is angled 90°, unless noted. Inch sizes meet ASME B18.3 and have a Class 3A thread fit. Metric sizes meet DIN 914/ISO 4027. *Metric 18-8 stainless steel* screws have a Class 6g thread fit; *metric black alloy steel* screws have a Class 5g6g thread fit. Length listed is the overall length.

Flat Point Set Screws

Great for making frequent adjustments, these hex socket set screws cause little or no damage to the surface they touch. You'll get the greatest contact using them on flat surfaces. Length listed is the overall length.

Inch Sizes— All have a Class 3A thread fit. Screw dimensions meet ASME B18.3. *Self-locking black alloy steel* screws are reusable and have a nylon patch on the threads that keeps them from vibrating loose. The patch retains its holding power at temperatures from –65° to +250° F.

Metric Sizes— *18-8 stainless steel* screws have a Class 6g thread fit; *metric black alloy steel* screws have a Class 5g6g thread fit. All metric sizes meet DIN 913/ISO 4026.

(Continued on following page)

Flat Point Set Screws *(Continued from previous page)*

Great for making frequent adjustments, these hex socket set screws cause little or no damage to the surface they touch. You'll get the greatest contact using them on flat surfaces. Length listed is the overall length.

Inch Sizes— All have a Class 3A thread fit. Screw dimensions meet ASME B18.3. *Self-locking black alloy steel* screws are reusable and have a nylon patch on the threads that keeps them from vibrating loose. The patch retains its holding power at temperatures from –65° to +250° F.

Metric Sizes— *18-8 stainless steel* screws have a Class 6g thread fit; *metric black alloy steel* screws have a Class 5g6g thread fit. All metric sizes meet DIN 913/ISO 4026.

Nylon Flat Point Set Screws

Nonconductive and chemical resistant, these hex socket set screws are an economical alternative to metal flat point set screws. A good choice if you'll be making frequent adjustments, they're tough, lightweight, and cause little damage to the surface they touch. Color is off-white. Temperature range is –40° to +185° F. Class 2A thread fit. Length listed is the overall length.

Oval Point Set Screws

The rounded point is ideal for angled surfaces, and since the area of contact is so small, these hex socket set screws cause little damage—even when frequently adjusted. Recommended for seating into varying types of shaft grooves. Screws have a Class 3A thread fit. Dimensions meet ASME B18.3. Length listed is the overall length.

Conformable Soft-Tip Set Screws

With rigid yet soft flat tips, these hex socket set screws conform to the texture and curves of a surface without marring. Ideal for use on gears and collars. Dimensions meet ASME B18.3. Screws have a Class 3A thread fit. Length listed does not include tip. Alloy steel screws have a minimum Rockwell hardness of C28.

***Silver Tip*—**Softer than brass; a small drop is enough to provide greater holding power. Conductive.

***Nylon Tip*—**Noise reducing, vibration damping, and nonconductive. Temperature range is –50° to +250° F.

***Brass Tip*—**The hardest tip material. Conductive.

Silver Tip 18-8 Stainless Steel—*Tip dimensions not available.*

Metric Conformable Soft-Tip Set Screws

Sized for metric applications, these hex socket set screws have a flat tip that's rigid, yet soft enough to conform to the textures and curves of a surface without marring. They also dampen vibration and are ideal for use on gears and collars. Screws meet ANSI/ASME B18.3.6M and have a Class 6g thread fit. Length listed does not include the tip. Alloy steel screws have a minimum Rockwell hardness of C28.

Nylon Tip—Noise reducing and nonconductive. Temperature range is –50° to +250° F.

Brass Tip—Harder than a nylon tip. Conductive.

Nylon Tip 18-8 Stainless Steel

Swivel Pad Set Screws for Angled Surfaces

With 7½° Swivel Pad ***With 10° Swivel Pad***

As you tighten these screws, a self-aligning pad swivels to make maximum contact against angled and uneven surfaces. Pads swivel in all directions and stop rotating upon contact to reduce damage if the screw is overtightened. Screws have a hex socket and a Class 2A thread fit. Length listed includes the pad.

Screws with 7½° Swivel Pad—The pad is narrower than the screw, so you can thread these screws straight through holes where clearance is limited. Pads are not removable. Pad and screw are made from black alloy steel. The pad has a minimum Rockwell hardness of C32; the screw has a minimum Rockwell hardness of C45.

Screws with 10° Swivel Pad—These screws have wider pads than the screws above, so they provide more gripping power. To use, remove the pad, thread the screw through the hole, and reattach the pad on the other side. Pad and screw are made from black 12L14 steel and have a minimum Rockwell hardness of C30. For replacement pads, see 90165A on page 3093.

Swivel Ball-Bearing Point Set Screws for Angled Surfaces

Ball bearings swivel in all directions to securely hold screws against angled surfaces with little chance of marring. Also known as ball-ended thrust screws, each has a hex socket drive and is made from alloy steel. Length listed includes the ball.

Inch sizes have a black finish and a Class 3A thread fit. Minimum Rockwell hardness is C45 for the screw and C60 for the ball.

Metric sizes have a black finish and a Class 6g thread fit. Minimum Rockwell hardness is C38 for the screw and C60 for the ball.

Flat-point screws have a flat-faced ball that swivels 9°.

Round-point screws have a completely round ball that swivels 360°.

For Ball-Nose Spring Plungers, see page 2602.

Flat Point *Round Point*

Also Available: Inch-size 18-8 stainless steel swivel ball-bearing point set screws with a Type 410 stainless steel ball. Please ask for 91688A205 for flat-point screws and 91658A141 for round-point screws; then specify thread size and screw length.

Set Screws for Indexable Tooling

Typically used to fasten indexable carbide inserts to tool holders, these screws should be replaced when they become worn. (Tool holders are marked with reference numbers to help you select the size you need.) Set screws have a hex socket drive in both ends (unless noted) and are made from heat-treated black alloy steel. Minimum Rockwell hardness is C42. Length listed is the overall length.

Clamp style screws hold tool-holding clamps at the proper height relative to tooling. They have right-hand threads on one end, left-hand threads on the other, and a Class 3A thread fit.

Lock-pin style screws fit into a hole in an insert to keep it in place. They have right-hand threads on one end.

★ Has hex drive in one end only.

Screws used in a tool holder.

Hollow-Lock Set Screws

Screws can be used behind a spring to adjust compression.

Also known as jam set screws, hollow-lock set screws are often used to lock other set screws in place, to hold pins, and to adjust spring tension. All screws have a hex socket that can be accessed from either end with a hex key. Class 3A thread fit. Length listed is the overall length.

18-8 stainless steel provides excellent corrosion resistance. It may be mildly magnetic and has a minimum Rockwell hardness of B80.

Black alloy steel offers mild rust resistance and some lubricity. It has a minimum Rockwell hardness of C48.

Cup Point Square Head Set Screws

With a prominent square head, these screws are easy to access by hand or with a wrench when you need more torque. All have a cup point that digs into the contact surface to provide high holding power. They're fully threaded and have a Class 2A thread fit. Dimensions meet ASME B18.6.2. Length is measured from under the head.

Type 316 stainless steel offers better corrosion resistance than 18-8 stainless steel and contains molybdenum, which increases corrosion resistance to chlorides and sulfates. It may be mildly magnetic and has a minimum Rockwell hardness of B100.

18-8 stainless steel provides excellent corrosion resistance. It may be mildly magnetic and has a minimum Rockwell hardness of B80.

Black alloy steel offers mild rust resistance and some lubricity. It has a minimum Rockwell hardness of C45.

Plain steel is case hardened C1006-C1022 steel. It has a minimum Rockwell hardness of C45.

For information about point selection, materials, and hex key sizes, see page 3072.

Precision-Adjustment Set Screws

These finely-threaded screws are your best choice for making ultra-precise adjustments to sensitive equipment. To install in unthreaded holes, use the optional threaded bushings (sold separately).

Screws have a hex socket drive and a round point. They're made entirely of 18-8 stainless steel and have a Class 3A thread fit. Not rated for hardness. Length listed is the overall length.

Optional threaded bushings are made from brass. They have a Class 3B thread fit and are not rated for hardness.

Extended-Point Square-Head Set Screws

Like dowel pins, you can use these screws to permanently lock one part to another. They have an extended point to guide them into mating holes or slots in your workpiece and a prominent head that's easy to access for tightening by hand or with a wrench. Also known as dog point and pilot point set screws, they're fully threaded (from under the head to where the extended point begins) and made from alloy steel. Length is measured from under the head to the end of the point.

Inch sizes have a black finish and a Class 2A thread fit. Minimum Rockwell hardness is C48. Metric sizes have a black finish and a Class 6g thread fit. Minimum Rockwell hardness is C20 for sizes up to M16 and C23 for size M20.

Quick-Latch Thumb Screws

Also known as quarter-turn thumb screws, these screws have a head designed to hold items such as access panels and covers in place. With the head properly positioned in a slot, a quick quarter turn latches or unlatches the screw.

Screws have a Class 2A thread fit and are made from black-oxide steel such as C1018 and 12L14. They have a minimum tensile strength of 64,000 psi and are not rated for hardness.

Hex Head Thumb Screws

You won't have a problem gripping these hex heads—they're tall enough to get your fingers around. If finger tightening isn't enough, you can use a wrench for more torque.

Made from 18-8 stainless steel, they're corrosion resistant and may be mildly magnetic. All are fully threaded and have a Class 2A thread fit. Minimum Rockwell hardness is B75. Minimum tensile strength is 80,000 psi.

Spade-Head Thumb Screws

Ideal for frequent adjustments. The wide head is easy to turn by hand—no tools required. All are fully threaded with a Class 2A thread fit, except metric zinc-plated malleable iron screws have a Class 8g thread fit. Head dimensions are approximate. ***18-8 stainless steel*** is corrosion resistant and can be mildly magnetic. Min. Rockwell hardness is B85. Tensile strength is 80,000 psi. ***Zinc-plated steel*** and ***plain steel*** are C1006-C1010 steel. Min. Rockwell hardness is B50. Tensile strength is 48,000 psi. Zinc-plated steel is also rust resistant. ***Zinc-plated steel screws with nylon tip*** have a soft, flat nylon tip that prevents marring. Not rated for hardness. Tensile strength is 48,000 psi. Length does not include nylon tip. Nylon temperature range is -50° to +250° F. ***Brass*** is softer than stainless steel. Min. Rockwell hardness is B55. Tensile strength is 55,000 psi. ***Metric zinc-plated malleable iron*** has a min. Rockwell hardness of B66. Tensile strength is 58,000 psi.

Spade-Head Thumb Screws with Shoulder

The shoulder serves as a large bearing surface, and like our other spade-head thumb screws, they have a wide head that's easy to grasp and turn by hand—no tools required. All screws are fully threaded and have Class 2A thread fit. Head and shoulder dimensions are approximate.

18-8 stainless steel is corrosion resistant and can be mildly magnetic. It has a min. Rockwell hardness of B85 and a tensile strength of 80,000 psi. ***Zinc-plated steel*** and ***plain steel*** are made from C1006-C1010 steel. They have a min. Rockwell hardness of B50 and a tensile strength of 55,000 psi. Zinc-plated steel is also rust resistant.

Wing-Head Thumb Screws

Wider than spade head screws, wing heads give you more gripping surface, so they're ideal for making frequent adjustments. Fully threaded; head width and head height are approximate. Inch sizes have a Class 2A thread fit. Thread fit for metric sizes made from steel is Class 6h; for those made from stainless steel it's 6g.

Zinc-plated malleable iron screws in inch sizes have a min. Rockwell hardness of B70 and a min. tensile strength of 45,000 psi. ***Zinc-plated iron*** screws in metric sizes meet DIN 316 (unless noted) and are not rated for hardness or tensile strength. ***Zinc-plated stamped steel*** screws are made from C1008-C1010 steel and are not rated for hardness or tensile strength.

18-8 stainless steel screws are corrosion resistant and can be mildly magnetic. They have a minimum Rockwell hardness of B80 and a minimum tensile strength of 72,500 psi.

Also Available: Plain malleable iron thumb screws in inch sizes. For ***Style 1*** please ask for 90195A700 and specify thread size and length. For ***Style 2*** please ask for 90196A300 and specify thread size and length.

Knurled-Head Thumb Screws

Narrow Head Unslotted

Narrow Head | Low Head | High Head

Not only are these thumb screws great looking, they're finely knurled for a comfortable, nonslip grip. 18-8 stainless steel screws come with your choice of slotted and unslotted heads, all other screws are unslotted. All screws are fully threaded (unless noted) and have a Class 2A thread fit.

18-8 stainless steel offers excellent corrosion resistance and may be mildly magnetic. Min. Rockwell hardness is B65. Min. tensile strength is 70,000 psi.

Black-oxide steel is made from 12L14 steel. It's rust resistant and has a min. Rockwell hardness of B84 and a min. tensile strength of 70,000 psi.

Brass is made from Alloy 360. It's softer than steel, corrosion resistant, and nonmagnetic. Min. Rockwell hardness is B78. Min. tensile strength is 58,000 psi.

Knurled-Head Thumb Screws with Shoulder

A high shoulder lifts the head off your work surface making these screws easier to grasp. Knurls prevent your fingers from slipping. All screws are fully threaded and have a Class 2A thread fit.

18-8 stainless steel offers excellent corrosion resistance and may be mildly magnetic. It has a min. Rockwell hardness of B80 and a min. tensile strength of 75,000 psi.

Black-oxide steel is made from 12L14 steel. It's rust resistant and has a min. Rockwell hardness of B68 and a min. tensile strength of 57,000 psi.

Brass is made from Alloy 360. It's nonmagnetic, softer than stainless steel, and corrosion resistant. Min. Rockwell hardness is B78. Min. tensile strength is 58,000 psi.

Small Diameter Knurled-Head Thumb Screws with Shoulder

They may be small, but the shoulder makes them easy to grasp and the knurls prevent your fingers from slipping. Also known as washer-face thumb screws, they're fully threaded and have a Class 2A thread fit.

Aluminum is made from lightweight Alloy 2011T3. It's nonmagnetic, has a lustrous finish, and is not rated for hardness or tensile strength.

18-8 Stainless Steel— Offers excellent corrosion resistance and may be mildly magnetic. Min. Rockwell hardness is B65. Min. tensile strength is 70,000 psi.

Brass— Is corrosion resistant, nonmagnetic, and softer than 18-8 stainless steel. Min. Rockwell hardness is B50. Min. tensile strength is 50,000 psi.

Metric Knurled-Head Thumb Screws

Choose a ***low head*** for tight spaces and a screw ***with shoulder*** when you need a raised head that's easy to get your fingers around.

18-8 stainless steel offers excellent corrosion resistance and may be mildly magnetic. Min. Rockwell hardness is B80. Min. tensile strength is 75,000 psi. Class 6g thread fit.

Black-oxide steel is made from 12L14 steel. Rust resistant. Min. Rockwell hardness is B80. Min. tensile strength is 70,000 psi. Class 6h thread fit.

Extended Point Thumb Screws

Insert the point into a drilled hole or slot to lock items in place. Also called dog points and pilot points, inch sizes have a Class 2A thread fit; metric sizes have a Class 6g thread fit.

18-8 stainless steel is corrosion resistant and can be mildly magnetic. Min. Rockwell hardness is B80. Min. tensile strength is 75,000 psi.

Black-oxide steel is rust resistant. Made from C1018 or 12L14 steel. Min. Rockwell hardness is B84. Min. tensile strength is 70,000 psi.

Screws ***with fluted head*** are made from black-oxide steel and are fully threaded. Inch sizes have a head made from black-oxide steel; metric sizes have a head made from zinc-plated cast iron.

Swivel-Pad Thumb Screws for Angled Surfaces

The pad swivels in all directions to make maximum contact with angled surfaces. It stops rotating when it touches the workpiece to reduce marring if the screw is overtightened. Screws are fully threaded.

Style A have a reduced diameter pad that can pass through tapped holes. Head and shaft are made from steel with a min. Rockwell hardness of C58. The pad swivels 7 1/2°. It's made from 41L40 steel with a min. Rockwell hardness of C32. All parts have a black-oxide finish and a min. tensile strength of 80,000 psi.

Style B have a removable pad that swivels 10°. To use, thread the screw through a hole. Screw parts are 12L14 steel with a black-oxide finish. Not rated for hardness. Tensile strength is 78,000 psi.

Style C have the largest pad, so they provide the most gripping power. To use, thread the screw through the hole, then snap the pad on from the other side. Pads swivel 10° and are made from steel such as C1018 or 12L14 with a black-oxide finish. Min. Rockwell hardness is C39. For more gripping strength, use an *optional extra large steel pad*; for a soft, nonmarring point, use an *optional nylon pad*.

A retaining spring holds the pads in place. Shafts are made from 12L14 steel with a black-oxide finish and a min. Rockwell hardness of C39. Heads are made from powdered metal and have a min. Rockwell hardness of B70. Shanks have a min. tensile strength of 70,000 psi. **Also Available:** Replacement retaining springs for Style C. Please ask for 90165A700 and specify thread size.

Plastic-Head Thumb Screws

Knurled

Rosette

Tee

With large, easy-to-grip heads, these screws are perfect when "finger-tight" is sufficient or if you need to make frequent adjustments. Made from acetal plastic, the heads withstand temperatures from 32° to 180° F.

All screws are made from 18-8 stainless steel and are fully threaded, except 4-40×1″ long, 10-32 ×1½″ long and ¼″-20×1½″, 1¾″, and 2″ long screws, which have at least ¾″ of thread. Inch sizes have a Class 3A thread fit; metric sizes have a Class 4g6g thread fit.

Knurled Head—To Order: Please specify color: black or red.

Informational Plastic Thumb Screw Heads

Etched with your choice of four important messages, these screw heads clearly communicate their purpose. They're made from black acetal and have knurled edges for better grip. Temp. range is 32° to 180° F. Press heads onto matching socket head cap screws (see pgs. 3105-3106) using a bench vise or arbor press.

To Order: Please specify message: Caution, Lock/Unlock, Do Not Remove, or Service Access.

Plastic-Head Thumb Screws with Graduations

Thumb Screw with Knurled Head and Lock Nut

Head Only (Rosette)

For accurate adjustments, each head is precisely etched with graduations in increments of 0.005″. Made from black acetal, all have a temperature range of 32° to 180° F.

Thumb screws feature a fully threaded, ¼″-20 black alloy steel shaft with a Class 3A thread fit. Use *thumb screws with lock nut* to hold your adjustments extra tight.

Heads only can be used to create custom length thumb screws. Press them onto ¼″-20 socket head cap screws (sold on page 3106) using a bench vise or arbor press.

Plastic-Head Thumb Screws with Socket Drive

Each screw head is press-fit onto a hex head cap screw so you can turn these screws by hand or with a hex key for more torque. Heads have knurled edges and are made from black acetal with a temperature range of 32° to 180° F. Screws are made from 18-8 stainless steel and are fully threaded (unless noted) with a Class 3A thread fit.

Precision-Adjustment Thumb Screws

Extremely fine threads give you exacting control. Screws have a Type 440 stainless steel ball-bearing point that's great for angled surfaces and has a small contact surface, so there's less chance of marring.

The head sits on a shoulder so it's easy to grab, and it's knurled so your fingers won't slip. Made from black acetal, it withstands temperatures up to 160° F.

The screw is made from 18-8 stainless steel. It's fully threaded and has a Class 3A thread fit. Screw components are not rated for hardness.

Also Available: Brass threaded bushings. Use to install thumb screws in existing holes. Please ask for 98625A300 for bushings for 3/16"-100 screws and 98625A900 for bushings for 1/4"-80 screws, then specify length: 5/16", 7/16", 5/8", or 3/4".

Big-Grip Clamp-On Thumb Screw Heads

Convert hex nuts and hex- and socket-head cap screws into thumb screws so large you can grip them with heavy work gloves. Head diameter is 2 3/4"; gripping surface is knurled. Made from aluminum Alloy 2011, they have a Rockwell hardness of B67.

For Hex Head Cap Screws

See pages 3134-3152 for hex head cap screws, pages 3105-3117 for socket head cap screws, and pages 3186-3189 for hex nuts.

Press-Fit Plastic Thumb Screw Heads

Create thumb screws that are the perfect length for your application. Just choose the head style you prefer and pair it with a socket head cap screw (sold on pages 3105-3117 and 3119-3122) of the same screw size. Press the head and screw together using a bench vise or arbor press. Temperature range is 32° to 180° F.

To Order: Please specify color: black, gray, red, or yellow.

Nylon Knurled-Head Thumb Screws

Nylon 6/6 with Slotted Head

Nylon 6/6 with Shoulder

Our nylon thumb screws are nonconductive, chemical resistant, and knurled to keep your fingers from slipping. All are fully threaded, have a Class 2A thread fit, and are not rated for hardness or tensile strength. *Note:* Nylon absorbs environmental moisture, which can affect dimensions and other properties.

Nylon 6/6 screws come with a *slotted head* (so you can also turn them with a screwdriver) or with a *shoulder* (which raises them so they're easier to grip). They withstand temperatures from –40° to +185° F.

To Order: Please specify black or off-white.

Glass-filled nylon screws are reinforced with glass fibers so they're extremely strong, and have a *shoulder*, which raises them so they're easier to grip. They withstand temperatures from –40° to +230° F. Color is off-white.

Nylatron screws have a low-profile head and are made with molybdenum disulfide so they're more wear resistant than those made from nylon 6/6. They withstand temperatures up to 260° F.

Slotted Head Captive Panel Screws

Knurled Head

Fillister Head

Retainer not included.

Use these nonmagnetic screws for panel assemblies, cabinets, and enclosures. They also work well as instrument hardware and needle valves in air-powered tools. To hold them captive in a panel, use with a retainer (sold separately; see page 3097 for inch size retainers). Install with a standard slotted screwdriver.

Screws are made from 18-8 stainless steel and have a Class 2A thread fit. They meet ASTM-A581-A582 and are not rated for hardness or tensile strength.

Also Available: Metric size screws, retainers, and springs. For screws, please ask for 95536A110 and specify thread size: M3, M3.5, or M4, and screw length. For retainers, please ask for 91065A800 and specify screw size: M3, M3.5, or M4. For springs that fit M3, M3.5, and M4 screws, please ask for 94125K472.

See pages 3279-3281 for more captive fasteners.

Prices are 15% lower when you buy in multiples of five.

Hex Socket Captive Panel Screws

With both a hex socket and a knurled head you can tighten these screws with a hex key or by hand. They're made from 18-8 stainless steel, have a Class 3A thread fit, and are not rated for hardness or tensile strength. To hold them captive in a panel, use the retainers sold separately on this page.

See pages 3279-3281 for more captive fasteners.

Binding Screws for Wood

Machine Screw

Machine Screw with Plates

Wood Screw

Use to join wood and wood composites.

Machine screws require a cap nut or a dowel nut (sold separately). Use a *cap nut* for a finished look on the back of a through hole and a *dowel nut* for an extra strong joint in a blind hole. ***Machine screw with plates*** is great for joining mitered corners. It comes with one threaded and one unthreaded plate. ***Wood screws*** have a low-profile head and require a 3/16″ diameter hole.

Retainers for Captive Panel Screws

Retainers and springs are made from 18-8 stainless steel.

Retainers hold screws "captive", so when you loosen them, they won't fall out and get lost. Package quantity is 25.

Springs provide even compression against panels. Package quantity is 5.

Light Duty Plastic Binding Posts

Also known as Chicago binding posts, these two-part fasteners consist of a screw and barrel—each with a slotted head. Snap pieces together with your fingers; the barrel closes around the screw, locking them together. Unscrew either end to disassemble.

Screws are made from nylon 6/6. Barrels are made from polyethylene. Both have a temperature range of −40° to +185°F. Head diameter is 3/8″; head height is 0.1″. Barrel diameter is 0.240″. Screw and barrel are not rated for hardness or tensile strength.

To Order: Please specify color: off-white or black.

Quick-Install Light Duty Binding Barrels and Caps

A snap to install, just tap the cap into the barrel with a hammer. Not reusable.

Aluminum Binding Barrel with Cap

Aluminum Binding Barrels with Cap—These two-part fasteners come complete with a binding barrel and a cap. Barrels are made from 6061-T6 aluminum and have a Rockwell hardness of B40. Use in 7/32″ holes. Caps are made from nickel-plated C1022 steel; they have a Rockwell hardness of C45. Once installed, caps cannot be removed.

Barrels and caps are not rated for tensile strength. Both have a 3/8″ dia. unslotted truss head that is less than 0.070″ high.

Plastic Binding Barrels and Plastic Caps—Sold separately; not rated for hardness or tensile strength. Barrels are made from polypropylene; caps are made from polycarbonate. Both materials are black and withstand temperatures from 20° to 120°F.

Plastic binding barrels have a slotted flat head that's 5/64″ Ht.×3/8″ Dia. Use in 1/4″ dia. holes.

Plastic caps come in permanent and removable styles. *Permanent caps* have an unslotted flat head that's 1/16″ Ht.×7/16″ Dia. Self-locking fins hold them in place. *Removable caps* have a slotted binding head that's 3/32″ Ht.×0.42″ Dia. Special threads allow you to unscrew and remove the caps.

Light Duty Binding Posts

Binding Post

Barrel Extension

Also known as Chicago binding posts, these two-part fasteners come complete with a barrel and screw. The screw has a slotted large-diameter (truss) head; the barrel has an unslotted large-diameter (truss) head. Screw size is 8-32. Thread length is 3/8″ (unless noted) for all materials except brass, which has a thread length of 5/16″ (unless noted). Barrel diameter is 13/64″. Barrels 3/8″ and shorter are tapped through; those 1/2″ and longer have a minimum thread depth of 3/8″ (unless noted).

To increase barrel length, add a ***barrel extension*** (sold separately below). Extensions are made from 6061-T6 aluminum. They have a minimum Rockwell hardness of B40 and a minimum tensile strength of 42,000 psi. Maximum usable thread depth is 3/8″ (unless noted).

18-8 Stainless Steel— More corrosion resistant than zinc-plated steel; may be mildly magnetic. Minimum Rockwell hardness is B80. Min. tensile strength is 80,000 psi.

Zinc-Plated Steel— Made from C1006 steel; offers good rust resistance. Minimum Rockwell hardness is B70. Min. tensile strength is 60,000 psi.

Plain Aluminum— Lightweight, corrosion resistant, and nonmagnetic. Screws are 6063 aluminum; barrels are 6061 aluminum. Minimum Rockwell hardness is B40. Min. tensile strength is 34,800 psi.

Black Anodized Aluminum— Made from 1100-H18 or 6061 aluminum. Lightweight, more corrosion resistant than plain aluminum, and nonmagnetic. Minimum Rockwell hardness is B38. Min. tensile strength is 23,000 psi.

Brass— Corrosion resistant and nonmagnetic. Minimum Rockwell hardness is B55. Min. tensile strength is 50,000 psi.

Heavy Duty Binding Posts

Also known as sex bolts and architectural bolts, these two-part fasteners come complete with a binding barrel and screw for anchoring all types of hardware. Barrels have a large-diameter (truss) head and knurls that prevent them from rotating in the hole. Screws have an 82° flat head with a Phillips drive.

Calculate your barrel length by deducting 3/16″ from the total thickness of the material you're fastening. For example, for a 1 3/8″ thick door, you'll need a 1 3/16″ long binding barrel. Install in a hole with a diameter equal to the barrel diameter.

Type 316 Stainless Steel and ***18-8 Stainless Steel—*** Corrosion resistant with a minimum Rockwell hardness of B85 and a minimum tensile strength of 80,000 psi. ***Brass—*** Has a minimum Rockwell hardness of B60 and a minimum tensile strength of 55,000 psi. ***Steel—*** Has a Rockwell hardness of B60 and a tensile strength of 50,000 psi.

Medium Duty Binding Barrels and Screws

Create a custom fastener—just pair a barrel with a machine screw. If you need extra barrel length, use a shoulder screw instead. Barrels and screws are sold separately. *Note*: The pin-in-star drive is compatible with tamper-resistant Torx drivers and bits.

Type 316 Stainless Steel—More corrosion resistant than 18-8 stainless steel. Rockwell hardness is B80. Min. tensile strength is 75,000 psi.

18-8 Stainless Steel—More corrosion resistant than zinc-plated steel; may be mildly magnetic. Min. Rockwell hardness is B85. Min. tensile strength is 80,000 psi.

Zinc-Plated Steel—Offers good rust resistance. Has a min. Rockwell hardness of B65 and a min. tensile strength of 55,000 psi.

Self-Locking Binding Barrels and Shoulder Screws

Also called Camtainer fasteners. Typically used in the trucking industry to fasten wood and composite paneling to metal frames. Barrels and screws (sold separately) are zinc-plated steel. Min. Rockwell hardness is C28; min. tensile strength is 120,000 psi.

Barrels have a low-profile head with a T55 Torx drive. ***Shoulder screws*** have a tamper-resistant, low-profile head with a PVC seal and a knurled shoulder that resists rotation. The seal is effective from –40° to +320° F. Adhesive on the threads adds vibration resistance.

Use the chart below to find the material thickness range that each barrel and shoulder screw pair can be used with.

Nylon Shoulder Screws

Our molded nylon fasteners are a lightweight, nonconductive alternative to metal shoulder screws. With a hex socket drive and a Class 2A thread fit, they withstand temperatures from –40° to +180° F. Shoulder diameter tolerance is –0.004" to –0.017"; shoulder length tolerance is ±0.015". They're not rated for hardness, tensile, or shear strength. *Note:* Nylon absorbs environmental moisture, which can affect dimensions and other properties.

To Order: Please specify color: black or off-white.

Stainless Steel Shoulder Screws

Also called stripper and shoulder bolts, these screws have a shoulder that serves as a bearing or spacer. They're used for locating parts, and as retaining components, guide screws, axle bolts, fulcrums, and pivots. Screws have a minimum Rockwell hardness of B55, a minimum tensile strength of 70,000 psi, and are not rated for shear strength. They have a hex socket drive and a Class 3A thread fit. Those with a shoulder diameter of 1/4" and larger meet ANSI/ASME B18.3. Shoulder dia. tolerance is –0.002" to –0.004"; shoulder length tolerance is ±0.005".

Type 316 and ***18-8 stainless steel*** provide excellent corrosion resistance and may be mildly magnetic. More corrosion resistant than 18-8 stainless steel, Type 316 stainless steel contains molybdenum, which increases resistance to chlorides and sulfates.

Self-locking screws have a nylon patch that keeps them from vibrating loose. Patches remain effective at temperatures from –70° to +250° F.

Alloy Steel Shoulder Screws

Also called stripper bolts and shoulder bolts, these screws have a cylindrical shoulder under the head that serves as a bearing or spacer. They're used for locating parts, and as retaining components, guide screws, axle bolts, fulcrums, and pivots. Screw heads and threads have a black finish and a hex socket drive.

All screws are made from alloy steel, have a Class 3A thread fit, and meet ANSI/ASME B18.3. Minimum Rockwell hardness is C32, minimum tensile strength is 140,000 psi, and shear strength is 84,000 psi (unless noted). Shoulder diameter tolerance is –0.004″; shoulder length tolerance is ±0.005″. Screws with a 1″ and smaller shoulder diameter meet ASTM A574. Those with a 1¼″ and a 1½″ shoulder diameter are not rated for shear strength.

Self-locking screws have a nylon pellet that keeps them from vibrating loose. Pellets remain effective at temperatures from –70° to +250°F.

Tamper-Resistant Medium Duty Binding Posts

You can install these two-part fasteners with a standard slotted screwdriver, but the one-way large-diameter (truss) head requires a special tool for removal (see 7392A on page 2835). Also known as partition sex bolts, they're made from 18-8 stainless steel.

Screw size is 10-24. The head is 27/64″ Dia.×7/64″ Ht. Barrels have a min. ⅜″ thread depth, a ¼″ diameter, and fit in ¼″ diameter holes. Min. Rockwell hardness is B85. Min. tensile strength is 85,000 psi.

Metric Shoulder Screws

Class 12.9 Alloy Steel

Self-Locking Class 12.9 Alloy Steel

We're offering metric versions of our most popular shoulder screws in wear-resistant Class 12.9 alloy steel with dimensions that are comparable to ISO 7379 (unless noted). They have a hex socket drive and a Class 5g6g thread fit.

All screws have a minimum Rockwell hardness of C39, a minimum tensile strength of 159,500 psi, and a shear strength of 95,700 psi. Shoulders have a diameter tolerance of –0.01 mm to –0.072 mm and a length tolerance of +0.25 mm to –0.00 mm. Heads and threads have a black finish.

Self-locking shoulder screws have a nylon patch bonded to the threads so the screws resist loosening due to vibration. The patch withstands temperatures from –70° to +250° F.

Self-Locking Precision Shoulder Screws

Slotted

Hex Socket

Get the dimensional accuracy you need, plus corrosion resistance and a firm grip. With a nylon patch bonded to the threads, these screws resist loosening due to vibration. The patch withstands temperatures from –70° to +250° F. Screws are made from 18-8 stainless steel and may be mildly magnetic. They have a shoulder diameter tolerance of +0.000″ to –0.001″ and a shoulder length tolerance of +0.002″ to –0.000″. Class 2A thread fit. Minimum Rockwell hardness is C20. Minimum tensile strength is 105,000 psi. Not rated for shear strength.

Precision Shoulder Screws

Exacting shoulder tolerances make these screws ideal for precision applications. Shoulder dia. tolerance is +0″ to –0.001″; shoulder length tolerance is +0.002″ to –0″. Screws have a Class 2A thread fit. Not rated for shear strength.

18-8 stainless steel provides excellent corrosion resistance; may be mildly magnetic. Min. Rockwell hardness is B65. Min. tensile strength is 90,000 psi (unless noted). Slotted screws with a Dash No. meet MS51575; those with a hex socket and a Dash No. meet MS51576. Screws with a star-shaped drive can be driven with Torx drivers and bits. Not rated for hardness or tensile strength. ***Type 416 stainless steel*** is stronger and harder than 18-8 stainless steel, but not as corrosion resistant. Magnetic. Min. Rockwell hardness is C26. Min. tensile strength is 123,000 psi. ***Alloy steel*** is high-strength Alloy 4140. Head and threads are black. Rockwell hardness is C32-C43. Min. tensile strength is 144,000 psi.

Also Available: Brass hex-socket screws in sizes marked with a ◆. Please ask for 95446A630 and specify shoulder dia. and length.

Metric Precision Shoulder Screws

Precision shoulder screws have tighter shoulder tolerances than standard versions, so they're ideal for critical applications. They're made of 18-8 stainless steel, which provides excellent corrosion resistance and may be mildly magnetic. Shoulder dia. tolerance is +0.000 mm to –0.025 mm; shoulder length tolerance is +0.05 mm to –0.00 mm. Screws have a Class 6g thread fit. Min. Rockwell hardness is B65; min. tensile strength is 90,000 psi. Not rated for shear strength.

Low-Profile Precision Shoulder Screws

With a narrow shoulder and a shallow, slotted head, these 18-8 stainless steel screws are perfect where space is limited. Shoulder dia. tolerance is +0.000″ to –0.001″; shoulder length tolerance is +0.002″ to –0.000″. Screws have Class 2A thread fit. Min. Rockwell hardness is B65; min. tensile strength is 90,000 psi. Not rated for shear strength.

Friction-Resistant Precision Shoulder Screws

With a thin, purple layer of titanium carbonitride (TiCN) on the head and shoulders, these precision shoulder screws resist wear caused by friction. The coating also provides increased lubricity for rotating components. Screws are made from 18-8 stainless steel, which is corrosion resistant and may be mildly magnetic. They have a shoulder diameter tolerance of +0.000″ to –0.002″ and a shoulder length tolerance of +0.003″ to –0.000″. All have a hex socket drive and a Class 2A thread fit. Not rated for hardness, shear, or tensile strength.

Hex Head Shoulder Screws

Often called wheel or axle bolts. All have a shoulder diameter tolerance of +0.000″ to –0.004″, a shoulder length tolerance of ±0.010″, and a Class 2A thread fit.

18-8 stainless steel screws are corrosion resistant and may be mildly magnetic. Min. Rockwell hardness is B70; min. tensile strength is 58,000 psi. Not rated for shear strength.

Zinc-plated steel screws are made from C1018 steel and offer good rust resistance. Minimum Rockwell hardness is B67; minimum tensile strength is 55,000 psi. Not rated for shear strength.

Alloy Steel Socket Head Cap Screw Thread Lengths

Sizes marked with a ♣ are always fully threaded.
For all other sizes, manufacturing standards allow threads to fall between the minimum and maximum lengths shown below.

Black-Oxide Alloy Steel

The standard among high-strength fasteners, these screws are made from an alloy steel that's comparable to Grade 8 steel and conforms to ASTM A574. They have a black-oxide finish that provides lubricity and mild rust resistance.

Screw sizes through 1″ have a Class 3A thread fit; screw sizes larger than 1″ have a Class 2A thread fit.

Screw sizes through 1/2″ have a minimum Rockwell hardness of C39 and minimum tensile strength of 180,000 psi; screw sizes larger than 1/2″ have a minimum Rockwell hardness of C37 and minimum tensile strength of 170,000 psi. Screw length is measured from under the head.

Black-Oxide Alloy Steel *(Continued from previous page)*

Fully Threaded♣

Partially Threaded

The standard among high-strength fasteners, these screws are made from an alloy steel that's comparable to Grade 8 steel and conforms to ASTM A574. They have a black-oxide finish that provides lubricity and mild rust resistance.

Screw sizes through 1″ have a Class 3A thread fit; screw sizes larger than 1″ have a Class 2A thread fit.

Screw sizes through ½″ have a minimum Rockwell hardness of C39 and minimum tensile strength of 180,000 psi; screw sizes larger than ½″ have a minimum Rockwell hardness of C37 and minimum tensile strength of 170,000 psi. Screw length is measured from under the head.

Self-Locking Black-Oxide Alloy Steel

Fully Threaded♣

Partially Threaded

A nylon locking patch bonded to the threads holds these screws firmly in place and prevents loosening from vibration. Patch withstands temperatures from −65° to +250° F.

Screws are made from an alloy steel that's comparable to Grade 8 steel and conforms to ASTM A574. It has mild rust resistance and some lubricity. Screws are reusable and have a Class 3A thread fit. Sizes through ½″ have a min. Rockwell hardness of C39 and min. tensile strength of 180,000 psi. The ⅝″ screws have a min. Rockwell hardness of C37 and min. tensile strength of 170,000 psi. Screws meet ANSI/ASME B18.3. Screw length is measured from under the head.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary; see page 3105 for more thread length information.

Zinc-Plated Alloy Steel

Fully Threaded♣

Partially Threaded

You'll get better rust resistance from our zinc-plated screws than you will from screws with a standard black-oxide coating. Screws are made from an alloy steel that's comparable to Grade 8 steel and conforms to ASTM A574.

All have a Class 3A thread fit. Sizes through ½″ have a minimum Rockwell hardness of C39 and minimum tensile strength of 180,000 psi. Sizes larger than ½″ have a minimum Rockwell hardness of C37 and minimum tensile strength of 170,000 psi. Screw length is measured from under the head.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3105 for more thread length information.

Ultra Corrosion-Resistant Coated Alloy Steel

Also known as armor coat, the coating on these screws provides better corrosion resistance than zinc, cadmium, and hot-dipped galvanized plating. It also provides salt spray resistance of 1,000 hours per ASTM B117 and does not interfere with the screw's Class 3A thread fit. Color is silver.

Screws are made from an alloy steel that's comparable to Grade 8 steel and conforms to ASTM A574. They meet ANSI/ASME B18.3 and have a minimum Rockwell hardness of C39 and a minimum tensile strength of 180,000 psi. Screw length is measured from under the head.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3105 for more thread length information.

(Continued on following page)

Ultra Corrosion-Resistant Coated Alloy Steel *(Continued from previous page)*

Fully Threaded♣

Partially Threaded

Coated with armor coat for better corrosion resistance than zinc, cadmium, and hot-dipped galvanized plating, plus resistance to 1,000 hours of salt spray per ASTM B117. The thickness of the coating does not interfere with the screw's Class 3A thread fit. Color is silver.

Screws are made from an alloy steel that's comparable to Grade 8 steel and conforms to ASTM A574. They meet ANSI/ASME B18.3 and have a minimum Rockwell hardness of C39 and minimum tensile strength of 180,000 psi. Screw length is measured from under the head.

Military Specification Cadmium-Plated Alloy Steel

Fully Threaded♣

Partially Threaded

Made to meet stringent military and aerospace specifications, these high-strength screws feature a cadmium-plated finish that provides better rust resistance than zinc plating.

Screws meet Military Specifications (MS) and National Aerospace Standards (NAS). They have a Class 3A thread fit, a minimum Rockwell hardness of C39, and a minimum tensile strength of 180,000 psi. Screw length is measured from under the head.

Torx Drive Black-Oxide Alloy Steel

Fully Threaded♣

Partially Threaded

The Torx drive handles high torque and prevents your driver from slipping. Screws are made from an alloy steel that's comparable to Grade 8 steel and conforms to ASTM A574. They have a black-oxide finish that provides lubricity and mild rust resistance. All have a Class 3A thread fit, a minimum Rockwell hardness of C39, and a minimum tensile strength of 180,000 psi. Screw length is measured from under the head. For Torx tools, see pages 2823-2824 and 2848-2850.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3105 for more thread length information.

For information about hex sizes, head dimensions, and thread lengths, see page 3105.

Nonmarring Soft-Point Black-Oxide Alloy Steel

To protect delicate surfaces, these screws have a soft point. Screws are made from a high-strength alloy steel that's comparable to Grade 8 steel and conforms to ASTM A574. Their black-oxide finish provides lubricity and mild rust resistance. They have a Class 3A thread fit, a minimum Rockwell hardness of C36, and a minimum tensile strength of 180,000 psi. They meet ANSI/ASME B18.3 and are reusable. Screw length is measured from under the head.

Nylon Point—Softer than brass, nylon points reduce vibration and eliminate damage from metal touching metal. Made from nylon 6/6, they withstand temperatures from –50° to +250° F and have a minimum Rockwell hardness of R105.

Brass Point—Harder than nylon, but not rated for hardness. Made from 60-65% copper, brass points are conductive.

Wire-Lockable Steel

Wire these drilled-head screws together so they can't vibrate loose. All have a Class 3A thread fit and meet ANSI/ASME B18.3. Screw length is measured from under the head.

Black-Oxide Alloy Steel—Comparable to Grade 8 steel. The black-oxide finish provides lubricity and mild rust resistance. Thread sizes through 1/2" have a min. Rockwell hardness of C39 and min. tensile strength of 180,000 psi. Thread sizes larger than 1/2" have a min. Rockwell hardness of C37 and min. tensile strength of 170,000 psi.

18-8 Stainless Steel—Meets ASTM F837, provides excellent corrosion resistance, and may be mildly magnetic. Screws have a min. Rockwell hardness of B70 and min. tensile strength of 70,000 psi.

For safety lock wire, see 8860K14 on pg. 3731. For wire twisting pliers, see pg. 2757.

Use safety lock wire (not included) to wire screws together.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3105 for more information.

Left-Hand Thread Black-Oxide Alloy Steel

Forget the "righty-tighty" rule—tighten these screws by turning counterclockwise. Screws are made from an alloy steel that's comparable to Grade 8 steel and conforms to ASTM A574. They have a black-oxide finish for lubricity and mild rust resistance. All are fully threaded and have a Class 3A thread fit. Meet ANSI/ASME B18.3. Min. Rockwell hardness is C39 and min. tensile strength is 180,000 psi. Screw length is measured from under the head.

Also Available: 18-8 stainless steel screws with a minimum tensile strength of 85,000 psi. in sizes marked with a ▲. Please ask for 92202A550 and specify thread size and screw length.

Stainless Steel Socket Head Cap Screw Thread Lengths

Sizes marked with a ♣ are always fully threaded.
For all other sizes, manufacturing standards allow thread length to vary between the minimum and maximum lengths shown below.

Stainless Steel

Fully Threaded♣

Partially Threaded

Our stainless steel socket head cap screws have a Class 3A thread fit, a min. Rockwell hardness of B70, and min. tensile strength of 70,000 psi. Screw length is measured from under the head. ***Type 316 stainless steel*** provides better corrosion resistance than 18-8 stainless steel and contains molybdenum, which increases corrosion resistance to chlorides and sulfates. May be mildly magnetic. ***18-8 stainless steel*** offers excellent corrosion resistance and may be mildly magnetic.

Type 316 Stainless Steel

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3112 for more thread length information.

● Head diameter is 0.343".

(Continued on following page)

Stainless Steel *(Continued from previous page)*

Fully Threaded♣

Partially Threaded

Our stainless steel socket head cap screws have a Class 3A thread fit, a minimum Rockwell hardness of B70, and minimum tensile strength of 70,000 psi. Screw length is measured from under the head.

18-8 stainless steel offers excellent corrosion resistance and may be mildly magnetic.

Military Specification Stainless Steel

Fully Threaded♣

Partially Threaded

Made from 300 series stainless steel, these screws are not only corrosion resistant, they also meet stringent Military Specifications (MS) and National Aerospace Standards (NAS). They're passivated (a nitric acid treatment that creates a film to protect against oxidation and corrosion) to QQ-P-35 and meet FF-S-86. All have a Class 3A thread fit, minimum tensile strength of 80,000 psi, and are not rated for hardness. Screw length is measured from under the head.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3112 for more thread length information.

For information about hex sizes and head dimensions, see page 3105.

Highly Polished Chrome-Plated Stainless Steel

Fully Threaded Screw ♣

Partially Threaded Screw

Optional Plug

The heads on these screws have no knurls—just a polished, mirror-like finish. Screws are made from nickel-chrome plated 18-8 stainless steel, which provides excellent corrosion resistance and may be mildly magnetic. They have a Class 3A thread fit, a minimum Rockwell hardness of B80, and minimum tensile strength of 95,000 psi. Screw length is measured from under the head.

Optional plugs are made from nickel-chrome plated steel. Press them into the hex opening of a screw to block debris and provide a sleek, finished look.

18-8 Stainless Steel with Captive Lock Washer

Never lose another washer. Each screw has a permanently attached but freely rotating split washer that holds tension constant to provide vibration resistance. Screw and washer are made from 18-8 stainless steel, which meets ASTM F837, offers excellent corrosion resistance, and may be mildly magnetic. All screws are fully threaded and have a Class 3A thread fit. Minimum Rockwell hardness is B81; minimum tensile strength is 80,000 psi. Dimensions meet ASME B18.3. Screw length is measured from under the head.

Self-Locking 18-8 Stainless Steel

A nylon locking patch bonded to the threads prevents loosening from vibration. The patch withstands temperatures from –70° to +250° F.

Screws are made from 18-8 stainless steel which provides excellent corrosion resistance and may be mildly magnetic. They're reusable and have a Class 3A thread fit. All have a min. Rockwell hardness of B100 and min. tensile strength of 100,000 psi. Dimensions meet ANSI/ASME B18.3. Screw length is measured from under the head.

Also Available: Self-sealing 18-8 stainless steel cap screws with attached silicone O-ring in sizes marked with a ★. O-ring temp. range is –85° to +450° F. Screws meet ANSI B18.3. Min. tensile strength is 55,000 psi. Please ask for 95198A330 and specify thread size and screw length.

Vented 18-8 Stainless Steel

Used in vacuum systems, these chemically cleaned and precision manufactured screws are drilled through the shaft to vent fluid and gas. They're made from 18-8 stainless steel, which provides excellent corrosion resistance and may be mildly magnetic. All have a Class 3A thread fit, a min. Rockwell hardness of B70, and min. tensile strength of 85,000 psi. Screw length is measured from under the head.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See pg. 3112 for more information.

High-Strength Corrosion Resistant

Count on these screws to hold up under the toughest conditions. Length is measured from under the head.

Bumax 88 Stainless Steel— Made from Type 316L stainless steel, Bumax 88 has a high molybdenum content for corrosion resistance similar to Type 316 stainless steel. Strength is comparable to Grade 5 steel. Screws meet ANSI/ASME B18.3 and may be mildly magnetic. Thread fit is Class 2A, min. Rockwell hardness is C25, and min. tensile strength is 116,000 psi.

A286 Super Alloy— With nearly 26% nickel and 15% chrome, this iron-based alloy provides corrosion resistance similar to 18-8 stainless steel and strength comparable to alloy steel. It conforms to Aerospace Material Specification (AMS) 5737 and National Aerospace Standard (NAS) 1352N, except 10-32 screws meet NAS 1351N. Screws are passivated (a nitric acid treatment that creates a film to protect against oxidation and corrosion) to QQ-P-35. Thread fit is Class 3A, min. Rockwell hardness is C33, and min. tensile strength is 160,000 psi.

Also Available: Titanium screws with a minimum tensile strength of 50,000 psi and a Class 2A thread fit. Please ask for 95435A110 and specify thread size and screw length.

Brass and Silicon Bronze

Corrosion resistant and nonmagnetic, these screws are fully threaded and have a Class 3A thread fit. Screw length is measured from under the head. ***Brass*** screws have a min. Rockwell hardness of B55 and min. tensile strength of 55,000 psi. ***Silicon bronze*** screws are made from 94-96% copper with a small amount of silicon for strength. A good conductor of heat, silicon bronze has a min. Rockwell hardness of B70 and min. tensile strength of 70,000 psi.

Nylon

Our nylon screws have an approximate Class 2A thread fit and are not rated for tensile strength. *Note:* Nylon absorbs environmental moisture, which can affect dimensions and other properties. Screw length is measured from under the head.

Nylon 6/6— Nonconductive and resistant to most chemicals and solvents (except mineral acids). Not rated for hardness. Temperature range is –40° to +185° F. **To Order:** Please specify black or off-white.

Glass-Filled Nylon— With the addition of 30% fiberglass, these screws are much stronger than those made from plain nylon. They have a temperature range of –40° to +230° F and are not rated for hardness. Color is off-white.

Also Available: Polypropylene screws. They're resistant to most chemicals and have a temperature range of –20° to +212° F. Not rated for tensile strength. Please ask for 99477A880 and specify thread size and screw length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary between a minimum of 1″ and maximum of 2 1/2″.

Low Head

Perfect for tight areas, low heads are about half the height of standard socket heads. All have a Class 3A thread fit. Screw length is measured from under the head. *Note:* Low head screws are not recommended for high strength applications.

18-8 Stainless Steel— Offers excellent corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B70. Minimum tensile strength is 70,000 psi. ***Black-Oxide Alloy Steel—*** Conforms to ASTM F835. Black-oxide finish provides lubricity and mild rust resistance. Minimum Rockwell hardness is C39; minimum tensile strength is 145,000 psi.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3105 for more thread length information.

Metric Low Head

With a head height that's half the height of a standard socket head, these screws are ideal for tight spaces. All screws have a Class 6g thread fit. Screw length is measured from under the head. *Note:* Low head screws are not recommended for high strength applications.

18-8 Stainless Steel— Offers excellent corrosion resistance and may be mildly magnetic. Minimum tensile strength is 101,000 psi. Not rated for hardness. ***Class 8.8 Steel—*** Made from steel with strength comparable to Grade 5 steel. Minimum Rockwell hardness is C22; minimum tensile strength is 116,000 psi. Screws have a dark surface color as a result of heat treatment.

Metric Class 12.9 Alloy Steel

Made from a high-strength steel alloy, these are the metric versions of our popular inch size alloy steel screws. Screw length is measured from under the head.

Standard thread and ***fine thread*** screws have a dark surface color as a result of heat treatment. They have a Class 5g6g thread fit, a minimum Rockwell hardness of C39, and minimum tensile strength of 174,000 psi. Dimensions meet DIN 912/ISO 4762. *Fine thread* screws allow precision adjustment.

High-visibility metric blue screws have a distinctive blue coating that makes them easy to distinguish from inch sizes. They meet ASTM A574M (similar to DIN 912 and ISO 4762) and ANSI/ASME B18.3.1M. All have a Class 4g6g thread fit, a minimum Rockwell hardness of C38, and minimum tensile strength of 176,900 psi.

Metric Self-Locking Class 12.9 Alloy Steel

A nylon patch bonded to the threads keeps these reusable, high-strength screws from loosening due to vibration. The patch withstands temperatures from –70° to +250° F. Screws have a dark surface color as a result of heat treatment. They have a Class 5g6g thread fit, a minimum Rockwell hardness of C39, and minimum tensile strength of 176,900 psi. Dimensions meet DIN 912/ISO 4762. Screw length is measured from under the head.

Metric Zinc-Coated Class 12.9 Alloy Steel

Class 12.9 screws are high strength and coated with a layer of zinc for rust resistance. Size M3 screws are zinc plated; all other sizes have a coating of zinc flake, which provides 600 hours of salt spray resistance. All screws are fully threaded and have a Class 5g6g thread fit. They have a minimum Rockwell hardness of C37 and tensile strength of 174,000 psi. Dimensions meet DIN 912/ISO 4762. Screw length is measured from under the head.

Metric Stainless Steel

Screws have a Class 6g thread fit and minimum tensile strength of 101,000 psi, but are not rated for hardness. Screw length is measured from under the head.

Type 316 stainless steel provides better corrosion resistance than 18-8 stainless steel and contains molybdenum, which increases corrosion resistance to chlorides and sulfates. May be mildly magnetic.

18-8 stainless steel provides good corrosion resistance and may be mildly magnetic.

Also Available: Plastic screws that withstand temperatures from –22° to +176° F in sizes marked with a ▲. Please ask for 93640A440 and specify thread size and screw length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3119 for more thread length information.

(Continued on following page)

Metric Stainless Steel *(Continued from previous page)*

Fully Threaded♣

Partially Threaded

Screws have a Class 6g thread fit and minimum tensile strength of 101,000 psi, but are not rated for hardness. Screw length is measured from under the head.

Type 316 stainless steel provides better corrosion resistance than 18-8 stainless steel and contains molybdenum, which increases corrosion resistance to chlorides and sulfates. May be mildly magnetic.

18-8 stainless steel provides good corrosion resistance and may be mildly magnetic.

Also Available: Plastic screws that withstand temperatures from –22° to +176° F in sizes marked with a ▲. Not rated for tensile strength. Please ask for 93640A440 and specify thread size and screw length.

Metric Flange-Head Class 12.9 Alloy Steel

The flange distributes holding pressure, so screws are less likely to come loose. All screws are made from alloy steel and have a black finish. They're fully threaded (unless noted) and have a Class 5g6g thread fit.

Minimum Rockwell hardness is C39; minimum tensile strength is 176,900 psi. Head height is measured from the bottom of the flange to the top of the head. Screw length is measured from under the flange.

Fully Threaded

About Flat-Head Socket Head Cap Screws

Sizes marked with a ♣ are always fully threaded. For all other sizes, manufacturing standards allow threads to fall between the minimum and maximum lengths shown below.

Use a countersink (see pages 2465-2470) to create a recess for flat head screws. The body diameter of your countersink should be equal to or larger than your screw's head diameter and its included angle should match your screw's head angle.

Alloy Steel Flat Head

Designed with a beveled neck and a flat head, these screws sit flush within countersunk holes. They meet ASTM F835 and have a Class 3A thread fit. Unless noted, screw sizes through 1/2″ have a minimum Rockwell hardness of C39 and minimum tensile strength of 144,000 psi; sizes larger than 1/2″ have a minimum Rockwell hardness of C37 and minimum tensile strength of 135,000 psi. Screw length is measured from the top of the head. *Note:* Flat head screws are not recommended for high strength applications.

Black-oxide alloy steel offers mild rust resistance and has some lubrication qualities.

Zinc-plated screws offer good rust resistance.

Self-locking black-oxide alloy steel screws have a nylon patch bonded to the threads that prevents loosening. They have a minimum tensile strength of 145,000 psi and are reusable. The patch withstands temperatures from –65° to +250° F.

Also Available: Military spec. MS24667 cadmium-plated alloy steel flat head cap screws in sizes marked with a ●. Minimum tensile strength is 130,000 psi. Please ask for 93401A555 and specify thread size and screw length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See top of page for more thread length information.
★ Head is undercut to 70% of standard height to allow more threading.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3124 for more thread length information.

Torx Drive Black-Oxide Alloy Steel Flat Head

The Torx drive handles high torque and prevents your driver from slipping. Screws are made from black-oxide alloy steel, which conforms to ASTM F835 and provides lubricity and mild rust resistance. All have a Class 3A thread fit. They have a minimum Rockwell hardness of C39 and minimum tensile strength of 145,000 psi. Screw length is measured from the top of the head. *Note:* Flat head screws are not recommended for high strength applications.

For Torx tools, see pages 2823-2824 and 2848-2850.

Stainless Steel Flat Head

Fully Threaded♣

Partially Threaded

Designed for light fastening jobs where you need a flush surface and corrosion resistance. All screws have a Class 3A thread fit, a Rockwell hardness of B70, and minimum tensile strength of 70,000 psi. Screw length is measured from the top of the head. *Note:* Flat head screws are not recommended for high strength applications.

Self-locking 18-8 stainless steel screws have a nylon locking patch bonded to the threads that increases holding power, adds vibration resistance, and withstands temperatures from –65° to +250°F. Self-locking screws are reusable.

Type 316 stainless steel provides excellent corrosion resistance—even better than 18-8 stainless steel. It contains molybdenum, which increases corrosion resistance to chlorides and sulfates. May be mildly magnetic.

18-8 stainless steel provides excellent corrosion resistance and may be mildly magnetic. The addition of an attractive ***black-oxide*** finish adds a bit of lubricity.

Also Available: Military spec. MS24671 300-series stainless steel flat head cap screws in sizes marked with a ●. Minimum tensile strength is 80,000 psi. Please ask for 94518A555 and specify thread size and screw length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3124 for more thread length information.
★ Head is undercut to 70% of standard height to allow more threading.

Brass Flat Head

Our brass flat heads are excellent conductors of electricity. They're nonmagnetic, soft, and corrosion resistant—plus, they sit flush when installed so they won't disrupt smooth surfaces. *Note:* Flat head screws are not recommended for high strength applications.

All screws are fully threaded and have a Class 3A thread fit. Minimum Rockwell hardness is B55; minimum tensile strength is 55,000 psi. Screw length is measured from the top of the head.

About Metric Flat-Head Socket Head Cap Screws

Use a countersink (see pages 2465-2470) to create a recess for flat head screws. The body diameter of your countersink should be equal to or larger than your screw's head diameter and its included angle should match your screw's head angle.

Metric Class 10.9 Steel Flat Head

Made from an alloy steel that's comparable to Grade 8 steel, these screws have been heat treated and are great for light fastening jobs where a flush surface is desired. All have a Class 6g thread fit and meet ISO 10642 (unless noted as meeting DIN 7991). They have a minimum Rockwell hardness of C32 and minimum tensile strength of 142,000 psi. Screw length is measured from the top of the head. *Note:* Flat head screws are not recommended for high strength applications.

High-visibility metric blue screws have a distinctive blue coating that makes them easy to distinguish from inch sizes.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See top of page for more thread length information.
♦ Meets DIN 7991.

For information about hex sizes, head dimensions, and thread lengths, see page 3128.

Metric Stainless Steel Flat Head

Perfect for light fastening jobs where flush mounting is desired. Screws are fully threaded and have a Class 6g thread fit. They may be mildly magnetic and have a minimum tensile strength of 100,000 psi. Not rated for hardness. Screw length is measured from the top of the head. *Note:* Flat head screws are not recommended for high strength applications.

Type 316 Stainless Steel— More corrosion resistant than 18-8 stainless steel. Contains molybdenum, which increases corrosion resistance to most chlorides and sulfates. ***18-8 Stainless Steel—*** Offers excellent corrosion resistance.

Type 316 Stainless Steel—DIN 7991-A4

Button Head

Fully Threaded♣

Partially Threaded

Self Locking

Screws provide a wide bearing surface, low head, and a finished appearance. Class 3A thread fit. Screw length is measured from under the head. *Note:* Button head screws are not recommended for high strength applications.

Self-locking screws are reusable. A nylon patch bonded to the threads keeps them from vibrating loose. Patches withstand temperatures from –65° to +250° F.

Type 316 Stainless Steel— More corrosion resistant than 18-8 stainless steel. May be mildly magnetic. Screws have a minimum Rockwell hardness of B85 and minimum tensile strength of 120,000 psi.

18-8 Stainless Steel and Black-Oxide 18-8 Stainless Steel— Have excellent corrosion resistance. May be mildly magnetic. Minimum Rockwell hardness is B70. Minimum tensile strength is 70,000 psi. *Black oxide* provides a decorative finish.

Self-Locking 18-8 Stainless Steel— Screws have a minimum Rockwell hardness of B85 and minimum tensile strength of 85,000 psi.

Zinc-Plated Alloy Steel and Black-Oxide Alloy Steel— Exceed Grade 5 and conform to ASTM F835. Minimum Rockwell hardness is C39 for sizes up to and including 1/2″ diameter; C37 for sizes larger than 1/2″ diameter. Minimum tensile strength is 144,000 psi for sizes up to and including 1/2″ diameter; 135,000 psi for sizes larger than 1/2″ diameter. Zinc plating offers good rust resistance. *Black oxide* offers mild rust resistance and some lubricity.

Self-Locking Black-Oxide Alloy Steel— Screws have a minimum Rockwell hardness of B85 and minimum tensile strength of 85,000 psi.

Also Available: Brass screws in the same sizes as the Type 316 SS screws listed below. Minimum tensile strength is 55,000 psi. Please ask for 97715A555 and specify thread size and screw length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3130 for more thread length information.

Flange Button Head

Like a built-in washer, the wide flange keeps the screw head from crushing thin or soft materials. Screws are fully threaded and have a Class 3A thread fit. Head height is measured from the bottom of the flange to the top of the head. Screw length is measured from under the flange. *Note:* Button head screws are not recommended for high strength applications.

18-8 Stainless Steel— Offers excellent corrosion resistance. May be mildly magnetic. Min. Rockwell hardness is B70. Min. tensile strength is 70,000 psi.

Black-Oxide Alloy Steel— Harder and stronger than 18-8 stainless steel, it has a black-oxide finish for lubricity and mild rust resistance. Min. Rockwell hardness is C39. Min. tensile strength is 145,000 psi.

Also Available: Metric sizes made from Class 10.9 alloy steel. They're fully threaded with a Class 6g thread fit. Min. Rockwell hardness is C32. Min. tensile strength is 150,000 psi. Please ask for 92137A100 and specify thread size and screw length.

Torx Drive Alloy Steel Button Head

Along with a wide bearing surface and low head height, these button heads have a Torx drive that handles high torque and prevents your driver from slipping. Screws have a black-oxide finish which offers lubricity and mild rust resistance. They're fully threaded and have a Class 3A thread fit. Min. Rockwell hardness is C39; min. tensile strength is 145,000 psi. Screw length is measured from under the head. *Note:* Button head screws are not recommended for high strength applications.

For Torx tools, see pages 2823-2824 and 2848-2850.

Also Available: Metric sizes made from zinc-coated Class 8.8 alloy steel. They're fully threaded with a Class 6g thread fit. Min. Rockwell hardness is C22. Min. tensile strength is 116,000 psi. Please ask for 92832A200 and specify thread size and screw length.

Tamper-Resistant Button Head

Pin-in-Torx

Pin-in-Hex

Fully Threaded♣ Pin-in-Torx

With a pin in the drive, these screws are virtually impossible to remove without special tools. (For Torx tools, see pgs. 2824 and 2848-2850; for hex tools, see pgs. 2821 and 2840.) Class 3A thread fit. Length is measured from under the head. *Note:* Not recommended for high strength applications.

18-8 Stainless Steel— Offers excellent corrosion resistance. May be mildly magnetic. Min. Rockwell hardness is B70; min. tensile strength is 70,000 psi.

Black-Oxide Alloy Steel— Harder and stronger than 18-8 stainless steel. The black-oxide finish provides lubricity and mild rust resistance. Min. Rockwell hardness is C38; min. tensile strength is 137,000 psi.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See pg. 3130 for more thread information.

High-Security 18-8 Stainless Steel Button Head

The rarer the drive, the more secure the screw. These have a drive configuration that you can get only from McMaster-Carr. They're fully threaded with a Class 2A thread fit, and made from 18-8 stainless steel, which offers excellent corrosion resistance and may be mildly magnetic. All have a min. Rockwell hardness of B80 and min. tensile strength of 85,000 psi. Screw length is measured from under the head. *Note:* Button head screws are not recommended for high strength applications.

Metric Button Head

Perfect when a wider bearing surface, low head height, or more finished appearance is desired. Screw length is measured from under the head. *Note:* Button head screws are not recommended for high strength applications.

18-8 Stainless Steel— Offers excellent corrosion resistance and may be mildly magnetic. Screws have a Class 6g thread fit, minimum tensile strength of 85,000 psi, and meet ISO 7380-A2. Not rated for hardness.

Class 10.9 Black-Finish Steel— Comparable to Grade 8 steel. The black finish provides mild rust resistance. Screws have a Class 5g6g thread fit. Minimum Rockwell hardness is C32. Minimum tensile strength is 150,800 psi. Dimensions meet ISO 7380 (unless noted).

Also Available: High-visibility blue coated screws with a minimum tensile strength of 145,000 psi in sizes marked with a ■. Made from Class 10.9 steel. Please ask for 94722A200 and specify thread size and screw length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. ● Does not meet ISO 7380.

Hex Head Cap Screw Thread Lengths and Head Dimensions

Sizes marked with a ♣ are always fully threaded. For all other sizes, manufacturing standards allow threads to fall between the minimum and maximum lengths shown below. For screws over 6″ long (except those made from stainless steel) add 1/4″ to thread lengths. For stainless steel screws 6 1/2″ to 11″ long, add 3 1/2″ to thread lengths; for those over 11″ long, add 5″.

Screw Dia.	1/4″	5/16″	3/8″	7/16″	1/2″	9/16″	5/8″	3/4″	7/8″	1″	1 1/8″	1 1/4″	1 1/2″	1 3/4″	2″

Extreme-Strength Steel—Grade 9

With a minimum tensile strength of 180,000 psi and a hefty head that's approximately 15-20% higher than a standard cap screw head, these are our strongest cap screws. All screws are made from high-grade alloy steel with a zinc yellow-chromate plating for added rust resistance. They have a Class 2A thread fit and a minimum Rockwell hardness of C38. Similar to PFC9, Tru-Torq, and Bow Malloy screws, they're also known as L9 screws and are grade-marked with nine radial lines, a dot, and the characters L9. Screw length is measured from under the head.

For best results, use with 95036A Grade 9 nuts on page 3188.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See top of page for more thread length information.

High-Strength Steel—Grade 8

Made from alloy steel, these tough screws have a Class 2A thread fit and are marked on the head with six radial lines to indicate Grade 8. Screws are coated with zinc yellow-chromate for rust resistance, except 1 1/8″ and larger diameters, which are plain steel. All screws have a minimum Rockwell hardness of C33 and minimum tensile strength of 150,000 psi. All meet ASME B18.2.1 and SAE J429, except screws with a 2″ diameter, which meet ASTM A354BD.

Screw length is measured from under the head. Screws that are fully threaded are also known as tap bolts.

Also Available: Grade 8 screws with a locking patch in sizes marked with a ★. The patch withstands temperatures from −65° to +250° F. Screws have a minimum tensile strength of 150,000 psi and meet ASME B18.2.1 and SAE J429. Please ask for 90019A500 and specify thread size and screw length.

(Continued on following page)

High-Strength Steel—Grade 8 (Continued from previous page)

Made from alloy steel, these tough screws have a Class 2A thread fit and are marked on the head with six radial lines to indicate Grade 8. Screws are coated with zinc yellow-chromate for rust resistance, except 1 1/8″ and larger diameters, which are plain steel. All screws have a minimum Rockwell hardness of C33 and minimum tensile strength of 150,000 psi. All meet ASME B18.2.1 and SAE J429, except screws with a 2″ diameter, which meet ASTM A354BD.

Screw length is measured from under the head. Screws that are fully threaded are also known as tap bolts.

Also Available: Grade 8 screws with a locking patch in sizes marked with a ★. The patch withstands temperatures from −65° to +250° F. Screws have a minimum tensile strength of 150,000 psi and meet ASME B18.2.1 and SAE J429. Please ask for 90019A500 and specify thread size and screw length.

Tension-Indicating High-Strength Steel

You'll know these cap screws are properly tightened when the indicator dot changes from red to black. The indicator is reliable at temperatures from −4° to +167° F.

Screws are made from alloy steel and have a zinc yellow-chromate plating for added rust resistance. They have a Class 2A thread fit and a minimum Rockwell hardness of C33.

Although not rated for strength, these screws have not less than 85% the tensile strength of equivalent size Grade 8 hex head cap screws. Screw length is measured from under the head.

Indicator color changes as tension increases or decreases.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3134 for more thread length information.

Ultra Corrosion-Resistant Coated High-Strength Steel—Grade 8

Fully Threaded♣

Partially Threaded

Compared to zinc plating, which can show rust in less than 200 hours, these screws can withstand 1,000 hours of salt spray resistance per ASTM B117. They have a silver-colored coating (also known as armor coat) that adds protection without affecting thread size.

Screws are made from alloy steel. They have a Class 2A thread fit and are marked on the head with six radial lines to indicate Grade 8. All have a minimum Rockwell hardness of C33, minimum tensile strength of 150,000 psi, and meet ASME B18.2.1 and SAE J429. Screw length is measured from under the head.

For nuts, see 93827A on page 3186; for washers, see 98180A on page 3219.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See pg. 3134 for more thread information.

Left-Hand Thread High-Strength Steel—Grade 8

Ideal for places where counterclockwise motion would cause common right-hand threaded screws to come loose; these screws tighten when turned to the left. Fully threaded with a Class 2A thread fit, they're made from alloy steel with a zinc yellow-chromate plating for added rust resistance. They have a minimum Rockwell hardness of C33, minimum tensile strength of 150,000 psi, and meet SAE J429. Each screw is marked on the head with six radial lines to indicate Grade 8. Screw length is measured from under the head.

Also Available: Grade 5 medium strength steel screws in sizes marked with ♦. All are fully threaded, except sizes 5/8"-11×4" and 3/4"-10×4", which are partially threaded. Screws have a minimum tensile strength of 120,000 psi. They meet SAE J429 and ASME B18.2.1. Please ask for 92190A100 and specify thread size and screw length.

Flange-Head High-Strength Steel—Grade 8

The flange increases contact area to give you extra holding power without a separate washer. Made from alloy steel, these screws have a black phosphate and oil finish that provides lubricity and mild rust resistance. They have a Class 2A thread fit and are marked on the head with six radial lines to indicate Grade 8. All have a minimum Rockwell hardness of C33, minimum tensile strength of 150,000 psi, and meet IFI-111 and SAE J429. Head height includes flange. Screw length is measured from under the flange.

Wire-Lockable Medium-Strength Steel—Grade 5

Fully Threaded♣ — Partially Threaded

Wire these drilled-head screws together and instead of vibrating loose, they'll hold tight. They're zinc plated for rust resistance and marked on top of the head with three radial lines to indicate Grade 5. Screws have a Class 2A thread fit, a minimum Rockwell hardness of C25, and minimum tensile strength of 120,000 psi. All meet ASME B18.2.1 and SAE J429. Screw length is measured from under the head.

For safety lock wire, see 8860K14 on page 3731. For wire twisting pliers, see page 2757.

Use safety lock wire (not included) to wire screws together.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See pg. 3134 for more thread information.

Vibration-Resistant Flange-Head Medium-Strength Steel—Grade 5

The serrated flange bites into surfaces and doesn't let go. Zinc plated for rust resistance, these screws are fully threaded with a Class 2A thread fit. Each head is marked with three radial lines to indicate Grade 5. All screws have a minimum Rockwell hardness of C25, tensile strength of 120,000 psi, and meet IFI-111 and SAE J429. Head height includes flange. Screw length is measured from under the head.

Also Available: Nonmarring flanged screws (without serrations) in sizes marked with a ★. Made from zinc-plated Grade 5 steel, they have a tensile strength of 120,000 psi and meet IFI-111 and SAE J429. Please ask for 92979A440 and specify thread size and screw length.

Medium-Strength Steel—Grade 5

Our medium strength screws have a Class 2A thread fit and are marked on the head with three radial lines to indicate Grade 5. 1″ and smaller diameters have a rust-resistant zinc plating, a minimum Rockwell hardness of C25, and minimum tensile strength of 120,000 psi. 1 1/8″ to 1 1/2″ diameters are plain steel with a minimum Rockwell hardness of C19 and minimum tensile strength of 105,000 psi. 1 3/4″ and 2″ diameters are plain steel with a minimum Rockwell hardness of B90 and minimum tensile strength of 90,000 psi.

All meet ASME B18.2.1. Screws with 1 1/2″ and smaller diameters meet SAE J429; those with 1 3/4″ and 2″ diameters meet ASTM A449. Screw length is measured from under the head. Fully threaded screws are also known as tap bolts.

(Continued on following page)

Medium-Strength Steel—Grade 5 (Continued from previous page)

Our medium strength screws have a Class 2A thread fit and are marked on the head with three radial lines to indicate Grade 5. 1″ and smaller diameters have a rust-resistant zinc plating, a minimum Rockwell hardness of C25, and minimum tensile strength of 120,000 psi. 1⅛″ to 1½″ diameters are plain steel with a minimum Rockwell hardness of C19 and minimum tensile strength of 105,000 psi. 1¾″ and 2″ diameters are plain steel with a minimum Rockwell hardness of B90 and minimum tensile strength of 90,000 psi.

All meet ASME B18.2.1. Screws with 1½″ and smaller diameters meet SAE J429; those with 1¾″ and 2″ diameters meet ASTM A449. Screw length is measured from under the head. Fully threaded screws are also known as tap bolts.

Military Specification Medium-Strength Steel—Grade 5

Made to stringent military specifications, these screws have a cadmium plating that provides better rust resistance than zinc plating—especially in salt water environments. Screws are marked on top of the head with three radial lines to indicate Grade 5. They have a Class 2A thread fit, minimum Rockwell hardness of C25, and minimum tensile strength of 120,000 psi. All meet MS 90725. Screw length is measured from under the head.

Also Available: Grade 8 zinc yellow chromate-plated high-strength alloy steel B1821BH screws in sizes marked with a ■. (B1821BH supersedes MS 90727 and 90728.) Screws have a minimum tensile strength of 150,000 psi and meet ASME B18.2.1, SAE J429, and ASTM A354. Please ask for 95362A330 and specify thread size and screw length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3134 for more thread length information.

Black-Finish Medium-Strength Steel—Grade 5

When details matter, black screws provide a professional, high-end look. All have a Class 2A thread fit and are marked on the head with three radial lines to indicate Grade 5. They have a minimum Rockwell hardness of C25 and minimum tensile strength of 120,000 psi. All meet ASME B18.2.1 and SAE J429. Screw length is measured from under the head.

Black luster is a semigloss coating that's extremely durable and provides corrosion resistance superior to both matte black and zinc-plated finishes. It's resistant to 500 hours of salt spray per ASTM B117. ***Matte black*** is a nonreflective surface treatment that provides lubricity.

Low-Strength Steel

Fully Threaded

Partially Threaded

Stop here if you're looking for economical cap screws for general purpose, noncritical applications. Made from steel with strength similar to that of Grade 2 steel, they have a Class 2A thread fit, minimum Rockwell hardness of B69, and minimum tensile strength of 60,000 psi. All meet ASME B18.2.1 and ASTM A307 (unless noted). 3/8" and larger diameters are marked on the head with A307 (unless noted). Screw length is measured from under the head. Fully threaded screws are also known as tap bolts.

For low-strength steel hex-head screws in machine screw sizes, see page 3061.

Zinc-Plated Steel—Coated with a layer of zinc for corrosion resistance.

Hot-Dipped Galvanized Steel—Has a thicker coating than zinc plate for excellent protection from rust, weather, and corrosion.

♦ Meets ASME B18.2.1 and SAE J429; head is not marked. ● Head height is 27/64".

High-Strength Corrosion-Resistant Metal

Depend on these screws to stand up where others fail. They have a Class 2A thread fit and dimensions that meet ASME B18.2.1 (unless noted). Screw length is measured from under the head.

A286 Super Alloy—With approximately 26% nickel and 15% chrome, this iron-based super alloy brings you the strength of alloy steel with corrosion resistance similar to 18-8 stainless steel. It meets ASTM A453 Grade 660 and is not magnetic. Screws have a minimum Rockwell hardness of C31 and minimum tensile strength of 140,000 psi.

17-4 PH Stainless Steel Alloy—Combines the high strength of alloy steel with the corrosion resistance of stainless steel. It meets ASTM F593 Grade 630 and is magnetic. Screws have a minimum Rockwell hardness of C31 and minimum tensile strength of 140,000 psi.

Nickel-Copper Alloy 400—Comparable to Monel, this material is corrosion resistant in salt water, so it's well suited for marine applications. It's strong, heat resistant, and slightly magnetic. Screws have a minimum Rockwell hardness of B80 and minimum tensile strength of 80,000 psi. They meet ASTM F468 and MIL-S-1222H Amendment 3, but do not meet ASME B18.2.1.

Titanium—With outstanding resistance to corrosion and high temperatures, this titanium is nearly as strong as steel, yet approximately 60% lighter. Not magnetic. Screws have a minimum Rockwell hardness of B80 and minimum tensile strength of 50,000 psi.

Fully Threaded♣

Partially Threaded

Also Available: Alloy 20 stainless steel (also known as Carpenter 20) screws in sizes marked with a ★. With excellent resistance to sulfuric acid, these screws have a minimum tensile strength of 80,000 psi. Please ask for 90765A100 and specify thread size and screw length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3134 for more thread length information.

Type 316 Stainless Steel

Step up to Type 316 stainless steel for superior corrosion resistance compared to 18-8 stainless steel. It contains molybdenum, which increases corrosion resistance to chlorides and sulfates. Screws may be mildly magnetic. They have a Class 2A thread fit, minimum Rockwell hardness of B70, and minimum tensile strength of 70,000 psi. Dimensions meet ASME B18.2.1. Screw length is measured from under the head. Fully threaded screws are also known as tap bolts.

For Type 316 stainless steel hex-head screws in machine screw sizes, see pg. 3061.

18-8 Stainless Steel

18-8 stainless steel offers excellent corrosion resistance and may be mildly magnetic. Screws have a Class 2A thread fit, minimum Rockwell hardness of B70, and minimum tensile strength of 70,000 psi. Dimensions meet ASME B18.2.1. Screw length is measured from under the head. Fully threaded screws are also known as tap bolts. For 18-8 stainless steel hex head screws in machine screw sizes, see page 3061.

Also Available: Self-locking 18-8 stainless steel screws in sizes marked with a ♦. Each has a locking patch that withstands temperatures from −70° to +250° F. Screws have a minimum tensile strength of 70,000 psi. Please ask for 91412A770 and specify thread size and screw length.

18-8 Stainless Steel *(Continued from previous page)*

Fully Threaded

Partially Threaded

18-8 stainless steel offers excellent corrosion resistance and may be mildly magnetic. Screws have a Class 2A thread fit, min. Rockwell hardness of B70, and min. tensile strength of 70,000 psi. Dimensions meet ASME B18.2.1. Screw length is measured from under the head. Fully threaded screws are also known as tap bolts. For 18-8 stainless steel hex head screws in machine screw sizes, see page 3061.

Military Specification Stainless Steel

Fully Threaded♣

Partially Threaded

Made to more stringent specifications than standard screws, these 300 series stainless steel screws meet FF-S-85 and are passivated (a nitric acid treatment that creates a film to protect against oxidation and corrosion) to QQ-P-35. All have a Class 2A thread fit, min. Rockwell hardness of B80, and min. tensile strength of 80,000 psi, except ¾"-10 screws, which have a min. Rockwell hardness of B74 and min. tensile strength of 70,000 psi. Screw length is measured from under the head.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3134 for more thread length information.

Wire-Lockable 18-8 Stainless Steel

To stop screws from vibrating loose, wire them together. Each screw is drilled through the head to accommodate safety lock wire (not included). For safety wire, see 8860K14 on page 3731. For wire twisting pliers, see page 2757.

Screws are made from 18-8 stainless steel, which offers excellent corrosion resistance and may be mildly magnetic. They have a Class 2A thread fit, minimum Rockwell hardness of B70, and minimum tensile strength of 75,000 psi. Screw length is measured from under the head.

Self-Sealing 18-8 Stainless Steel

Each screw comes with a silicone O-ring that seals out contaminating liquids and gases at pressures up to 20,000 psi (when used in the hole sizes recommended below).

Screws are reusable. UL recognized and CSA certified, they're made from 18-8 stainless steel, which offers excellent corrosion resistance and may be mildly magnetic. Each has a Class 2A thread fit, min. Rockwell hardness of B85, and min. tensile strength of 85,000 psi. Screw length is measured from under the head.

Also Available: Replacement O-rings. *Silicone* rings have a temperature range of –150° to +500° F; *fluoroelastomer* rings have a range of –20° to +400° F and are resistant to chemicals and oil. Please ask for 97284A990 and specify material and screw size.

Left-Hand Thread 18-8 Stainless Steel

Tighten these fully threaded screws by turning them counterclockwise. They're made from 18-8 stainless steel, which offers excellent corrosion resistance and may be mildly magnetic. Screws have a Class 2A thread fit, minimum Rockwell hardness of B65, and minimum tensile strength of 70,000 psi. Screw length is measured from under the head.

Vibration-Resistant Flange-Head 18-8 Stainless Steel

With a wide, serrated flange, these screws fight the tendency to jiggle free. Screws are made from 18-8 stainless steel, which offers excellent corrosion resistance and may be mildly magnetic. Screws have a Class 2A thread fit. Head dimensions meet IFI-111. Min. Rockwell hardness is B100. Min. tensile strength is 100,000 psi. Head height includes the thickness of the flange. Screw length is measured from under the flange.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See pg. 3134 for more thread information.

Aluminum

Made from Alloy 2024-T4, these cap screws have the strength of mild steel yet are only one-third the weight. They're nonmagnetic and resistant to corrosion caused by weather. All are fully threaded with a Class 2A thread fit, min. Rockwell hardness of B40, and min. tensile strength of 37,000 psi. Screw length is measured from under the head.

Silicon Bronze

Made from Alloy 651 (which contains 96% copper with silicon for added strength), these cap screws are extremely resistant to the corrosive effects of sea water, gases, and sewage. They're also nonmagnetic and good conductors of heat and electricity. All screws are fully threaded with a Class 2A thread fit and head dimensions that meet ASME B18.2.1. They have a min. Rockwell hardness of B70 and min. tensile strength of 70,000 psi. Screw length is measured from under the head.

Brass

Fully Threaded♣

Partially Threaded

Often selected for their attractive gold tone, our brass cap screws are non-magnetic and corrosion resistant. They have a Class 2A thread fit, minimum Rockwell hardness of B55, and minimum tensile strength of 55,000 psi. Screw length is measured from under the head.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3134 for more thread length information.
● Minimum thread length is 1 3/4" up to fully threaded.

Plastic

Fully Threaded♣

Partially Threaded

Fully Threaded♣ with Flange

Plastic cap screws resist chemicals and corrosion better than most of their metal counterparts. They're nonconductive and not rated for hardness or tensile strength. All have a Class 2A thread fit. Screw length is measured from under the head (or flange where applicable). Fully threaded screws are also known as tap bolts.

Nylon 6/6—An economical choice, nylon 6/6 screws resist aromatic, chlorinated, and ketone solvents; gasoline; oil; grease; and both animal and vegetable oils. They're reliable at temperatures from –40° to +185° F. *Note:* Nylon absorbs moisture, which can affect dimensions and other properties. **To Order:** Please specify color: black or off-white.

PVC—Resistant to corrosion caused by weak acids, alkalies, and alcohols, PVC screws withstand temperatures up to 120° F. Color is gray.

Fiberglass—Made from polyurethane reinforced with glass fiber, these screws are stronger than nylon screws. They tolerate corrosive environments, chemical exposure, and temperatures from –40° to +150° F. Screws *with flange* provide better grip thanks to the extra bearing surface the flange provides. All fiberglass screws are gray.

Also Available: PTFE screws in sizes marked with a ■. Fully threaded. Reliable at temperatures from –100° to +500° F. Color is white. Please ask for 91297A520 and specify thread size and screw length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See pg. 3134 for more thread information.
♥ Minimum thread length is 1". ★ Minimum thread length is 1 1/2".
♦ Minimum thread length is 2 1/4".

For information about thread lengths and head dimensions, see page 3134. For nuts, see pages 3186-3216.

Extreme-Strength 12-Point Flange-Head—Alloy Steel and Stainless Steel

Stronger than Grade 8 steel, these cap screws have a 12-point drive that provides more driver contact than a hex head—so they can handle more torque. To install, use a 12-point wrench that matches the head width of your screw. All have a plain finish and Class 3A thread fit. Head height includes the thickness of the flange. Screw length is measured from under the flange.

For 12-point wrenches, see pages 2774-2775; for 12-point sockets, see pages 2790, 2795, and 2801.

Alloy Steel—Screws meet ASTM A574; dimensions meet IFI-115. Sizes through 1/2″-20 have a min. Rockwell hardness of C39 and min. tensile strength of 180,000 psi; larger sizes have a min. Rockwell hardness of C37 and min. tensile strength of 170,000 psi.

Stainless Steel—Screws up to 1″ long are made from Type 304 stainless steel; those longer than 1″ are made from Type 450 stainless steel. Minimum Rockwell hardness is C38 and minimum tensile strength is 170,000 psi. Unless noted, 1/4″-20 to 5/16″-24 screws have a 1″ thread length and 3/8″-16 to 3/8″-24 screws have a 1 1/8″ thread length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See page 3134 for more thread length information; for alloy steel screws, add 1/4″ to the thread lengths listed.

Metric Maintenance Assortments

Two great 7,060-piece assortments—one in steel and one in 18-8 stainless steel. Furnished in a metal, 11 1/4″ Ht.× 15 1/4″ Wd.×11 3/4″ Dp. four-drawer cabinet. Drawers are 2″ Ht.×13 3/8″ Wd.×9 1/4″ Dp.; each has a lid chart. Pieces in the steel assortment are zinc-plated, except the DIN 916 and DIN 912 pieces which have a black finish.

- **Set Screws—DIN 916:** 10 each: M4×4, 6; M5×5, 8; M6×6, 8.

Metric High-Strength Steel—Class 10.9

Made from steel that's comparable to Grade 8 steel, these screws come with your choice of a black finish or high-visibility blue coating. All have a Class 6g thread fit and are marked on the head with 10.9. Screw length is measured from under the head. Fully threaded screws are also known as tap bolts.

Black finish screws have a minimum Rockwell hardness of C32 and minimum tensile strength of 150,000 psi.

High-visibility blue screws have a minimum Rockwell hardness of C33 and minimum tensile strength of 150,800 psi. Fully threaded screws meet DIN 933; partially threaded screws meet DIN 931.

Also Available: Class 10.9 steel screws with a zinc yellow-chromate plating. They have a Class 6h thread fit and minimum tensile strength of 150,000 psi. Please ask for 90854A113 for fully threaded DIN 933 screws and 95327A501 for partially threaded DIN 931 screws; then specify screw size and length.

♣ Fully threaded. For all other sizes, manufacturing standards allow thread length to vary. See top of page for more thread length information.

Metric Medium-Strength Steel—Class 8.8

Made from zinc-plated, heat-treated steel that's comparable to Grade 5 steel. All have a Class 6h thread fit. Sizes M6 and larger are marked on the head with 8.8. Screw length is measured from under the head. Fully threaded screws are also known as tap bolts.

Sizes through M16 have a minimum Rockwell hardness of C21 and minimum tensile strength of 116,000 psi; larger sizes have a minimum Rockwell hardness of C23 and minimum tensile strength of 120,000 psi.

Also Available: Self-locking Class 8.8 steel screws in sizes marked with a ♦. Each has a locking patch that withstands temperatures from –58° to +392° F. Screws meet DIN 933 and have a minimum tensile strength of 116,000 psi. Please ask for 96755A880 and specify thread size and screw length.

Metric Fine-Thread Medium-Strength Steel—Class 8.8

Fully Threaded

Partially Threaded

With finer threads than comparable hex head cap screws, these screws are perfect for your precision applications. They're made from zinc-plated, heat-treated steel that's comparable to Grade 5 steel. All have a Class 6h thread fit and are marked on the head with 8.8. They have a minimum Rockwell hardness of C22 and minimum tensile strength of 116,000 psi. Screw length is measured from under the head. Fully threaded screws are also known as tap bolts.

Fully Threaded—DIN 961

Metric Type 316 Stainless Steel

Made from Type 316 stainless steel, these fully threaded DIN 933-A4 screws are more corrosion resistant than 18-8 stainless steel screws and contain molybdenum, which increases resistance to chlorides and sulfates. Also known as tap bolts, they have a Class 6g thread fit and may be mildly magnetic. All have a minimum tensile strength of 101,500 psi but are not rated for hardness. Screw length is measured from under the head.

Also Available: Acidproof Bumax 88 screws (made from high-strength Type 316L stainless steel with a high molybdenum content) in sizes marked with a ★. Meet ISO 4017. Minimum tensile strength is 116,000 psi. Please ask for 93810A200 and specify thread size and screw length.

Metric Vibration-Resistant Flange-Head Medium-Strength Steel

No need for a separate washer, these black finish screws have a serrated flange that bites into surfaces—adding shake resistance and holding power. All screws are fully threaded and have a Class 6g thread fit. Sizes M10 and smaller are made from steel similar to Class 9.8 steel; larger sizes are made from steel similar to Class 10.9 steel. All are stronger than both Grade 5 and Metric Class 8.8 steel screws.

Minimum Rockwell hardness is C27; minimum tensile strength is 130,500 psi. Head height includes the thickness of the flange. Screw length is measured from under the head.

Also Available: Nonmarring flanged screws (without serrations) in the sizes listed below. Made from Class 10.9 steel with a black-phosphate finish, they have a minimum tensile strength of 150,000 psi. Please ask for 98093A100 and specify thread size and screw length.

★ Lock washers are zinc-plated.

For information about thread lengths, see page 3154. For nuts, see pages 3186-3216.

Metric Brass

Softer than steel and stainless steel. Nonmagnetic. Made from corrosion-resistant CU2 or CU3 brass. Fully threaded with a Class 6g thread fit. Meet DIN 933. Min. Rockwell hardness is B55. Min. tensile strength is 53,000 psi. Screw length is measured from under the head.

Metric Nylon

Our fully threaded nylon 6/6 cap screws are nonconductive and resistant to chemicals and solvents (except mineral acids). They withstand temperatures from –40° to +180°F, but are not rated for hardness or tensile strength. (*Note:* Nylon absorbs moisture which can affect dimensions and other properties.) Screw length is measured from under the head.

To Order: Please specify color: black or off-white.

The Difference Between a Bolt and a Screw

A ***bolt*** is designed to be inserted through a hole and secured with a nut, while a ***screw*** is designed to be used in a threaded hole—sometimes along with a nut. To learn more, see the American Society of Mechanical Engineers (ASME) standard B18.2.1 (1996).

Medium-Strength Steel Heavy Hex Head Structural Bolts—ASTM A325

Partially Threaded

Bolts meet ASME B18.2.6 and ASTM A325 Type 1 for structural steel joints. Marked with A325, the head is wider than a standard hex head. All bolts have a Class 2A thread fit. Bolts ½″ through 1″ dia. have a minimum Rockwell hardness of C24 and minimum tensile strength of 120,000 psi. 1¼″ dia. bolts have a minimum Rockwell hardness of C19 and minimum tensile strength of 105,000 psi. Bolt length is measured from under the head.

Plain Steel— For plain nuts, see 90580A on page 3189; for structural washers see 98038A on page 3219.

Hot-Dipped Galvanized Steel— Has a thick coating that offers excellent protection against rust, weather, and corrosion. For galvanized nuts, see 95025A on page 3190; for structural washers, see 98119A on page 3219.

Heavy Hex Head Bolts—ASTM A193

Grade B7

Designed for bolting pressure vessels, valves, and flanges, each bolt has a head that's wider than a standard hex head. All have a Class 2A thread fit. Bolt length is measured from under the head.

Alloy steel Grade B7 bolts are made from chromium-molybdenum alloy steel with a plain finish. Marked on the head with B7, they have a maximum Rockwell hardness of C35 and minimum tensile strength of 125,000 psi. For ASTM A194 Grade 7 nuts, see 94485A on page 3190.

18-8 stainless steel Grade B8 bolts are made from corrosion-resistant 18-8 stainless steel, which may be mildly magnetic. Marked on the head with B8, they have a maximum Rockwell hardness of B100 and minimum tensile strength of 75,000 psi. For ASTM A194 Grade 8 nuts, see 94252A on page 3190.

Also Available: Type 316 stainless steel ASTM Grade B8M bolts with a minimum tensile strength of 75,000 psi. Please ask for 92790A550 and specify thread size and bolt length.

Low-Strength Steel T-Handle Bolts

You decide where to locate the collar; just slide it along the shaft and weld it in place. Also called clamping pins, these T-handle bolts have a black-oxide finish that provides mild rust resistance.

All bolts have a Class 2A thread fit and 3/4" thread length. Minimum Rockwell hardness is C43; minimum tensile strength is 78,000 psi.

For Grade 2 plain steel nuts, see 90490A on page 3187.

Round Countersunk-Head Bolts

No. 3 Flat Head

No. 3 Dome Head

No. 7 Flat Head

Also known as plow bolts, these bolts are beveled under the head to sit within countersunk holes. Designed to resist turning when tightened with a nut, they conform to SAE J429 and are well-suited for heavy equipment. Each has a Class 2A thread fit and is marked on top of the head with three radial lines to indicate Grade 5 or six radial lines to indicate Grade 8. Bolt length is measured from the top of the head.

No. 3 Flat Head, Square Neck— Made from Grade 5 medium-strength steel with zinc plating for rust resistance. Minimum Rockwell hardness is C25. Minimum tensile strength is 120,000 psi. Dimensions meet ASME B18.9. For nuts, see 95462A on page 3186.

Also Available: Flat head, square neck, Grade 5 plain steel bolts with a min. tensile strength of 120,000 psi and dimensions that meet ASME B18.9. Please ask for 90005A583 and specify thread size and bolt length.

No. 3 Dome Head, Square Neck— Made from Grade 8 high-strength steel and zinc plated for rust resistance. Minimum Rockwell hardness is C33. Minimum tensile strength is 150,000 psi. For nuts, see 94895A on page 3186.

Also Available: Dome head, square neck, Grade 8 plain steel bolts with a minimum tensile strength of 150,000 psi. Please ask for 92315A669 and specify thread size and bolt length.

No. 7 Flat Head, Key Locking— Also known as reverse-key plow screws and bucket tooth bolts, key-locking bolts have a single integral locking key that holds the bolt still as you tighten the nut. They're made from Grade 8 high-strength plain steel. Minimum Rockwell hardness is C33. Minimum tensile strength is 150,000 psi. For nuts, see 90499A on page 3186.

Large Diameter Flush-Head Low-Strength Bolts with Nut

Also known as elevator and step bolts, these low-profile bolts sit flush when installed. Frequently used in industrial belting systems, they have a Class 2A thread fit, min. Rockwell hardness of B88, and min. tensile strength of 74,000 psi. Bolts are fully threaded except fanged versions, which have an unthreaded shoulder. Bolt length is measured from the top of the head.

1 ***Square Neck***—Bolts resist spinning when you tighten the nut.

2 ***Fanged***—Sharp "teeth" hold tight so the bolts can't spin.

3 ***Ribbed with Slotted Drive***—Also known as reliance bolts, these bolts provide a tight, vibration-free fit when used with a heavy washer. The head has a smaller diameter than the heads of square-neck and fanged styles.

18-8 stainless steel provides excellent corrosion resistance and may be slightly magnetic. For 18-8 stainless steel washers, see 93852A on pg. 3217. *Zinc-plated steel* is made from C1010-C1020 steel and offers good rust resistance. For steel washers, see 90108A on pg. 3217 .

Also Available: Metric zinc-plated steel bolts with nut in square-neck and fanged styles. Minimum tensile strength is 74,000 psi. For square-neck style, ask for 93226A100; for fanged style, ask for 92963A200; then specify thread size and bolt length.

Square-Head Steel Bolts

Square heads offer plenty of surface for your wrench to grip—and that means less slippage. All have a Class 2A thread fit. Bolt length is measured from under the head. For square nuts, see page 3195.

Medium-Strength Steel—Grade 5 bolts have a zinc yellow-chromate plating and are marked on the head with three radial lines to indicate Grade 5. Each bolt has a min. Rockwell hardness of C25, min. tensile strength of 120,000 psi, and meets ASME B18.2.1 and SAE J429.

Low-Strength Steel—ASTM A307 Grade A bolts have a plain finish, min. Rockwell hardness of B69, and min. tensile strength of 60,000 psi.

Square-Head Medium-Strength Steel T-Bolts

Also known as tugger bolts, these bolts clamp work securely without damaging your machine table. They're made from C1045 steel (which has strength comparable to Grade 5 steel) and have a black-oxide finish that offers lubricity and mild rust resistance. Each has a Class 2A thread fit, min. Rockwell hardness of C28, and min. tensile strength of 120,000 psi. Bolt length is measured from under the head. For nuts, see 91026A on page 3190.

Also Available: Heavy-duty black-oxide alloy-steel bolts in sizes marked with a ★. Forged from 4140 steel, they have a minimum tensile strength of 140,000 psi. Please ask for 91622A555 and specify thread size and bolt length.

Medium-Strength Steel T-Slot Bolts

Inch Bolt

Metric Bolt

The bolt heads are designed to slide into the T-slot in your machine tool table without twisting—so they won't cause any damage.

Plain Steel—Bolts are forged from C1045 steel. They have a Class 3A thread fit, min. Rockwell hardness of C18, and min. tensile strength of 100,000 psi.

Black-Oxide Alloy Steel—Forged from 4140 steel, these bolts are stronger than those made from plain steel. They have a black-oxide finish that provides lubricity and mild rust resistance. Each has a Class 2A thread fit, min. Rockwell hardness of C32, and min. tensile strength of 140,000 psi.

Metric Black-Finish Steel—Made from class 10.9 steel (which is comparable to Grade 8 steel), these metric T-slot bolts meet DIN 787 and have a square head marked with 10.9. They have a black finish that provides lubricity and mild rust resistance. Each has a Class 6g thread fit, min. Rockwell hardness of C32, and min. tensile strength of 150,000 psi.

Low-Strength Steel Hold-Down Bolts with Nut and Washer—ASTM A307 Grade A

1

2

Zinc plated for rust resistance. Furnished with a nut and washer. Have a Class 2A thread fit, min. Rockwell hardness of B69, and min. tensile strength of 60,000 psi.

Medium-Strength Acute-Angle Anchor Bolts

Similar to the L-hook anchor bolts on page 3149, but with a smaller, 63° interior angle. Intended for structural anchoring, these bolts are made from steel that's comparable to Grade 5 steel and meet SAE J429. They have a Class 2A thread fit, minimum Rockwell hardness of C25, and minimum tensile strength of 120,000 psi. Thread length is 2"-3 1/4".

For hex nuts, see pages 3186 and 3190. For flat washers, see pages 3218 and 3219.

Low-Strength Anchor Bolts

Designed for structural anchoring. All have a Class 2A thread fit and are not rated for hardness. Bolts with an ***L-hook*** have a right (90°) angle. For hex nuts, see pages 3186, 3187, and 3190. For flat washers, see pages 3218 and 3219.

Plain Steel— Made from steel that meets ASTM A36, these bolts have a min. tensile strength of 58,000 psi.

Hot-Dipped Galvanized Steel— Made from steel that meets ASTM A36. Thickly coated with zinc for excellent protection from rust and weather. Min. tensile strength is 58,000 psi.

18-8 Stainless Steel— Your best choice for corrosion resistance. May be mildly magnetic. Min. tensile strength is 70,000 psi.

Flattened-End Hanger Bolts, Screws, Anchors, and Nuts

Each of these zinc-plated steel hangers has a flat end with a hole, making it ideal for tie-wire applications. Use them for wire guiding as well as for hanging pipe, fixtures, and other assemblies such as suspended ceilings.

Toggle Bolt Hangers— A popular choice for overhead applications. The *toggle bolt with spring* is easy to install because the spring holds the washer and toggle against opposite sides of the wall, so everything's in position before you begin tightening. Once tightened, the spring adds vibration resistance. Toggle bolts with spring are not rated for hardness; those without a spring have a minimum Rockwell hardness of B69.

Machine Screw Hangers— Also known as spade bolts, you can use these versatile hangers in a threaded hole (as you would a screw), or secure them with a nut (as you would a bolt). Minimum Rockwell hardness is B69. All meet ASTM A307.

Self-Drilling Hanger Screws— Use in steel up to 12-ga. thick. Install with a *driver tool* (at right). Not rated for hardness.

Sharp-Point Hanger Screws— Drive these into wood with an adjustable wrench, pliers, or a *driver tool* (sold separately at right). Not rated for hardness.

Wedge Anchor— Use in concrete and other solid materials. Minimum Rockwell hardness is B69.

Eye Nuts— Also known as eye couplings and tie-wire nuts, use eye nuts to add wire guides to threaded rod and expansion anchors. Minimum Rockwell hardness is B69.

High-Strength Alloy Steel Threaded Rods—Grade 8

Made from heat-treated alloy steel that meets ASTM A354 BD, these threaded rods are ideal for applications requiring high strength.

They have a Class 2A thread fit, minimum Rockwell hardness of C33, and minimum tensile strength of 150,000 psi. Length is measured from end to end.

For matching hex nuts, see 98427A on page 3189 for all sizes except 3/8"-16. For 3/8"-16 size, see 90521A225 on page 3190.

Medium-Strength Alloy Steel Threaded Studs and Rods—ASTM A193 Grade B7

Considered the standard for bolting pressure vessels, valves, and flanges, these studs and rods are made from chromium-molybdenum AISI 4140 alloy steel. Length is measured from end to end (unless noted). All lengths have a Class 2A thread fit, maximum Rockwell hardness of C35, and minimum tensile strength of 125,000 psi.

For matching hex nuts, see 90521A on page 3190.

Seize-Resistant Medium-Strength Alloy Steel Threaded Studs—ASTM A193 Grade B7

Studs have a blue coating that contains PTFE and provides excellent rust resistance, great lubricity, and prevents the friction that causes nuts to stick. All studs are made from chromium-molybdenum alloy steel. They have a Class 2A thread fit, maximum Rockwell hardness of C35, and minimum tensile strength of 125,000 psi. Length is measured from end to end.

For matching hex nuts, see 90212A on page 3190.

Medium-Strength Alloy Steel Threaded Studs and Rods for High Temperatures—ASTM A193 Grade B16

With the addition of vanadium, these chromium-molybdenum alloy steel fasteners can tolerate intense heat. Stronger than Grade B7 studs and rods, they're designed for use in pressure vessels, valves, and flanges.

All have a Class 2A thread fit, maximum Rockwell hardness of C35, and minimum tensile strength of 125,000 psi. Length is measured from end to end.

For matching hex nuts, see 94485A on page 3190.

Hot-Dipped Galvanized Low-Strength Steel Threaded Studs and Rods

With a thick hot-dipped galvanized coating, these rods and studs are better protected against rust, weather, and corrosion than zinc-plated studs and rods. All have a Class 1A thread fit, minimum tensile strength of 53,000 psi, and are not rated for hardness. Length is measured from end to end.

Use with oversized tapped nuts (see 90371A on page 3187). For washers, see 98970A on page 3217.

Zinc-Plated Low-Strength Steel Threaded Studs and Rods

Made from general purpose low-strength steel, these threaded studs and rods are zinc plated for rust and weather resistance. Length is measured from end to end.

Lengths shorter than 1 ft. have a Class 1A thread fit; longer lengths have a Class 2A thread fit. All have a minimum Rockwell hardness of B61 and minimum tensile strength of 53,000 psi.

For matching hex nuts, see pages 3185-3192.

Low-Strength Steel Threaded Studs and Rods

Keep expenses down with these economical studs and rods. Made from general purpose low-strength steel, they have a minimum Rockwell hardness of B61 and minimum tensile strength of 53,000 psi, unless noted. Lengths shorter than 1 ft. have a Class 1A thread fit; longer lengths have a Class 2A thread fit. Length is measured from end to end.

For matching hex nuts, see pages 3185-3192.

Type 316 Stainless Steel Threaded Studs and Rods

With the addition of molybdenum, Type 316 stainless steel studs and rods are more corrosion resistant than those made from 18-8 stainless steel. They're also resistant to chemicals and solvents. Length is measured from end to end. For matching hex nuts, see pages 3185-3192.

Type 316 stainless steel may be mildly magnetic. Unless noted, studs and rods have a Class 1A thread fit and min. Rockwell hardness of B70. All have a min. tensile strength of 70,000 psi.

Type 316 stainless steel—ASTM A193 Grade B8M may be mildly magnetic. Studs and rods have a Class 2A thread fit and min. tensile strength of 75,000 psi. Diameters up to ¾″ have a max. Rockwell hardness of B100; larger diameters have a max. Rockwell hardness of B96.

High-strength Type 316 stainless steel—ASTM A193 Grade B8M is strain hardened to increase its strength and may be mildly magnetic. Studs and rods have a Class 2A thread fit, max. Rockwell hardness of C35, and min. tensile strength of 95,000 psi.

♦ Has a Class 2A thread fit and maximum Rockwell hardness of B100.

18-8 Stainless Steel Threaded Studs and Rods

Made from 18-8 stainless steel, these studs and rods are corrosion resistant and may be mildly magnetic. All have a Class 1A thread fit, unless noted. Length is measured from end to end.

18-8 stainless steel studs and rods have a minimum Rockwell hardness of B70 (unless noted) and minimum tensile strength of 70,000 psi. For matching hex nuts, see pages 3185-3192.

Black-oxide 18-8 stainless steel studs and rods have a matte-black finish that provides a bit of lubricity. They have a minimum tensile strength of 75,000 psi and are not rated for hardness. For matching hex nuts, see 97149A on page 3187.

18-8 stainless steel—ASTM A193 Grade B8 studs and rods are made from Type 304 stainless steel. They're designed for bolting applications in pressure vessels, valves, and flanges. Those with diameters up to 3/4" have a maximum Rockwell hardness of B100; larger diameters have a maximum Rockwell hardness of B96. Minimum tensile strength is 75,000 psi. For matching hex nuts, see 94252A on page 3190.

Titanium Threaded Rods

Made from nonmagnetic Grade 2 titanium, these lightweight rods have a high strength-to-weight ratio and are exceptionally resistant to corrosion from salt water and numerous chemicals. They have a Class 2A thread fit, minimum Rockwell hardness of B80, and minimum tensile strength of 50,000 psi. Length is measured from end to end.

For matching hex nuts, see 90545A on page 3187.

Silicon Bronze Threaded Studs and Rods

Made from 98% copper with a small amount of silicon for strength, silicon bronze is more resistant to corrosion from salt water than brass. It's nonmagnetic, an excellent conductor of electricity, and meets ASTM B98.

Studs and rods have a Class 1A thread fit (unless noted). They have a minimum tensile strength of 55,000 psi, but are not rated for hardness. Length is measured from end to end.

For matching hex nuts, see 93439A on page 3187.

High-Strength Corrosion-Resistant Threaded Rods

For your most challenging environments, we offer rods in a variety of materials—each with a unique set of problem-solving benefits. All rods have a Class 2A thread fit. Length is measured from end to end.

Alloy 20 stainless steel is also known as Carpenter 20 and is the most resistant to hot sulfuric acid and cracking from stress and corrosion. A high-nickel stainless steel with about four times as much nickel as 18-8 stainless steel, it may be slightly magnetic and meets ASTM B473. Rods have a minimum Rockwell hardness of B85 and minimum tensile strength of 80,000 psi. For matching hex nuts, see 90775A on page 3187.

Type 410 stainless steel—ASTM A193 Grade B6 is stronger and harder than 18-8 and Type 316 stainless steels. It's magnetic and ideal for mildly corrosive environments such as steam and weak acids. Rods have a minimum Rockwell hardness of B98 and minimum tensile strength of 110,000 psi. For matching hex nuts, see 99129A on page 3187.

Hastelloy C276 is a nonmagnetic nickel super alloy that meets ASTM B574 and is suitable for welding. It's resistant to pitting, cracking from stress and corrosion, oxidation, and corrosive chemicals such as chlorine. Rods have a minimum tensile strength of 110,000 psi but are not rated for hardness. For matching hex nuts, see 95012A on page 3187.

Nickel-copper Alloy 400 is sometimes called Monel. It's a nickel super alloy that's stronger than brass and particularly resistant to heat and corrosion caused by salt water and caustic solutions. It may be slightly magnetic and meets ASTM B164. Rods have a minimum Rockwell hardness of B70 and minimum tensile strength of 80,000 psi. For matching hex nuts, see 90810A on page 3187.

Brass Threaded Studs and Rods

Brass studs and rods resist rust and atmospheric corrosion. They're also nonmagnetic and good conductors of electricity. Lengths shorter than 1 ft. are made from Alloy 270 to Alloy 360 brass; longer lengths are made from Alloy 360 brass. All have a Class 1A thread fit (unless noted), minimum Rockwell hardness of B55, and minimum tensile strength of 50,000 psi. Length is measured from end to end. For matching hex nuts, see 92671A on page 3185 and 92676A on page 3187.

♦ Class 2A thread fit.

Plastic Threaded Studs and Rods

For corrosive environments and electrical applications, nonmetallic studs and rods are often your best choice. They're nonconductive, have a Class 2A thread fit (unless noted), and are not rated for hardness or tensile strength. Length is measured from end to end.

For matching hex nuts, see page 3188.

General Purpose Nylon 6/6— Resistant to chemicals and solvents (except mineral acids), these economical studs and rods are reliable at temperatures up to +185° F. *Note:* Nylon absorbs moisture, which can affect dimensions and other properties.

High Strength Fiberglass— Stronger than nylon, fiberglass is made from vinyl ester reinforced with glass fiber. Rods tolerate corrosive environments, chemicals, and temperatures from –31° to +140° F.

Chemical Resistant PVC— Resistant to moisture, acids, alkalies, salt solutions, and alcohols, these studs and rods tolerate temperatures up to 120° F.

Gen. Pur. Nylon 6/6—To Order: *Please specify black or off-white.*

Aluminum Threaded Studs and Rods

Made from general purpose Alloy 6061-T6 aluminum, these corrosion-resistant studs and rods are not only ideal for outdoor use, they're also nonmagnetic and one-third the weight of steel.

All have a Class 1A thread fit and minimum tensile strength of 42,000 psi, but are not rated for hardness. Length is measured from end to end.

For matching hex nuts, see 93181A on page 3185 and 90670A on page 3187.

Metric Medium-Strength Steel Threaded Rods—*Class 8.8*

Made from heat-treated Class 8.8 steel, these threaded rods have a Class 6g thread fit, minimum Rockwell hardness of C20, and minimum tensile strength of 115,000 psi. Length is measured from end to end.

Zinc-plated steel rods meet DIN 975 and are rust and weather resistant; ***plain steel*** rods are free of coatings and finishes.

For matching hex nuts, see 90591A Class 8 nuts on page 3193.

Metric Medium-Strength Alloy Steel Threaded Studs and Rods—ASTM A193 Grade B7

The standard for bolting pressure vessels, valves, and flanges, these studs and rods are made from chromium-molybdenum AISI 4140 alloy steel. They have a Class 6g thread fit, maximum Rockwell hardness of C35, and minimum tensile strength of 124,000 psi. Length is measured from end to end (unless noted).

Zinc yellow-chromate plated alloy steel rods are rust and weather resistant. ***Plain alloy steel*** studs and rods are free of coatings and finishes; those with a ***fine thread*** allow precision adjustment.

For matching hex nuts, see pages 3192-3194.

Metric Stainless Steel Threaded Studs and Rods

These threaded studs and rods have a Class 6g thread fit and minimum tensile strength of 70,000 psi, but are not rated for hardness. Length is measured from end to end.

Type 316 stainless steel contains molybdenum for better corrosion resistance than 18-8 stainless steel. It's resistant to chemicals, solvents, and pitting, and may be mildly magnetic. Lengths 300 mm and longer meet DIN 975. For matching hex nuts, see 94150A on page 3193 ***18-8 stainless steel*** provides excellent corrosion resistance. 1- and 2-meter long rods meet DIN 975. For matching hex nuts, see 91828A on page 3193.

Metric Brass Threaded Rods—*DIN 975*

Made from CU2 or CU3 brass, these rods are resistant to rust and weather-related corrosion. They're also nonmagnetic and good conductors of electricity. Each has a Class 6g thread fit, minimum Rockwell hardness of B77, and minimum tensile strength of 53,000 psi. Length is measured from end to end.

For matching hex nuts, see 90690A on page 3193.

Metric Nylon Threaded Rods

Our economical, off-white nylon 6/6 rods are nonconductive and resistant to chemicals and solvents (except mineral acids). They're reliable at temperatures up to 185° F and have a Class 6g thread fit. (*Note*: Nylon absorbs moisture, which can affect dimensions and other properties.) Not rated for hardness or tensile strength. All are 1 meter long. Length is measured from end to end.

For matching hex nuts, see 93800A on page 3193.

18-8 Stainless Steel One-End-Threaded Studs

Screw the threaded end into a tapped hole and use these studs as locator pins. All studs are made from 18-8 stainless steel, which provides corrosion resistance and may be mildly magnetic. They have a Class 2A thread fit and minimum tensile strength of 75,000 psi, but are not rated for hardness. Overall length is measured from end to end.

For matching hex nuts, see page 3187.

High-Strength Steel Socket-Drive Thread Adapter Studs

With a hex socket in one end, these studs are easy to install with a hex key. Also known as step studs, they're made from high-strength Alloy 8740 chrome-moly steel and have a black-oxide finish. All have a Class 3A thread fit and minimum Rockwell hardness of C38. Minimum tensile strength is 170,000 psi (similar to that of SAE Grade 8 steel). Length is measured from end to end.

Spacing Studs

Also known as setup and driver studs, these studs are typically used in clamping applications. Inch sizes have a Class 2A thread fit; metric have a Class 6g thread fit.

18-8 stainless steel studs have a min. Rockwell hardness of B83 and min. tensile strength of 85,000 psi (unless noted). They have excellent corrosion resistance and may be mildly magnetic. For matching hex nuts, see page 3187.

Black-oxide steel studs are made of C1541 steel. The black-oxide finish provides lubricity and mild rust resistance. Studs have a min. Rockwell hardness of C27 and min. tensile strength of 125,000 psi. Those marked with a ★ have flat areas on the shank that facilitate installation with a wrench. For matching hex nuts in inch sizes see 95479A on page 3186; for metric sizes see page 3193.

Black Class 8.8 steel studs are made from medium-strength steel and provide mild rust resistance. They have a minimum Rockwell hardness of C22 and minimum tensile strength of 116,000 psi. For matching hex nuts, see page 3193.

★ Shank has flat sides.

Steel Right- and Left-Hand Threaded Studs

For complicated assemblies, these studs have right-hand threads on one end and left-hand threads on the other. Threads are the same length on both ends.

Studs are made from C1018-C1117 steel. They have a black-oxide finish that provides lubricity and mild rust resistance. Each has a Class 2A thread fit, minimum Rockwell hardness of B67, and minimum tensile strength of 70,000 psi. For matching hex nuts, see pages 3186, 3187, and 3189.

Self-Locking Studs—Thread Lengths Are Different

Studs are threaded for a nut on one end and threaded (with self-locking friction-fit threads) for insertion into a threaded hole on the other. Also known as milled and tap-end studs, they have a Class 5 thread fit on the tap end (metric have Class SK6) and a Class 2A thread fit on the nut end (metric have Class 6g). For matching hex nuts in inch sizes, see pages 3186-3191; for metric sizes, see pages 3192-3194.

18-8 stainless steel studs provide excellent corrosion resistance and may be mildly magnetic. They have a tensile strength of 85,000 psi but are not rated for hardness. ***Plain steel*** studs are made from C1215 low-strength steel. They have a tensile strength of 65,000 psi but are not rated for hardness. ***Metric plain steel*** studs are made from Class 8.8 medium-strength steel. They have a minimum Rockwell hardness of C22 and tensile strength of 116,000 psi.

Hollow Threaded Studs—Thread Lengths Are the Same

With a hollow center, these studs are ideal to use as axles, vents, or passageways for wiring. Studs are made from 4130 chromium-molybdenum alloy steel. They have a black-oxide finish that provides mild rust resistance and some lubricity. All studs have a Class 2A thread fit and minimum Rockwell hardness of B90 but are not rated for tensile strength. Length is measured from end to end.

Coil-Threaded Rods, Nuts, and Bolts

Rod

Hex Nut

Flange Nut

Wing Nut

Bolt

Coil threads are shallow so they don't collect debris. Clean threads allow fast nut threading, which makes them great for quick assembly and dismantling.

Rods are made from plain C1040 steel. They have a min. Rockwell hardness of C23 and min. tensile strength of 80,000 psi. Length is measured from end to end. Nuts are not rated for hardness. ***Hex nuts*** are plain C1008-C1010 steel. ***Flange nuts*** have a large bearing surface that's great for covering holes. They're made from plain ductile iron. ***Wing nuts*** lend themselves to easy hand assembly. They're made from plain ductile iron.

Bolts are made from plain C1040 steel. They have a min. tensile strength of 80,000 psi and are not rated for hardness. Length is measured from under the head.

Through-Hole Weld Studs

Make these studs a permanent part of almost any assembly. Simply pass them through a hole and weld them in place with a spot or MIG welder. Projections under the head increase the weld area. Studs are made from plain C1008-C1010 welding quality steel. They have a Class 2A thread fit. Length is measured from under the head.

Right-Angle Weld Studs

Perfect when you need a permanent stud in a confined area such as a narrow channel or tight corner. The flat spade accommodates various electrode tip sizes for spot welding to (or through) metal surfaces. All have a Class 2A thread fit.

18-8 stainless steel offers excellent corrosion resistance and may be mildly magnetic.

Plain steel is made from C1010 welding quality steel.

Low-Profile Button Head Machine Screws

Choose shallow-head machine screws when space is limited. With plenty of surface area for your driver, the Torx drive ensures slip resistant installation. For drivers, see pages 2848-2850; for bits, see pages 2823-2824.

Screws are made from zinc-plated steel. Length is measured from under the head.

Perforated Base Studs

Thanks to a perforated base, you can screw, weld, or rivet a stud wherever you need one. Base plates (0.047″ thick) have a 1 1/2″ overall diameter and are perforated with 0.157″ dia. and 0.197″ dia. holes. All studs have a Class 2A thread fit.

Type 316 stainless steel offers superior corrosion resistance.

Zinc-plated steel studs are made from C1008 steel with a yellow-chromate finish.

Studs—Stud length does not include the thickness of the base.

Insulation Hanger Studs

Pin Style Self-Adhesive Stud ***Pin Style Plain Stud*** ***Slot Style Plain Stud*** ***Washer for Pin Style Stud*** ***Washer for Slot Style Stud***

Here's a great way to attach insulation to almost any flat surface. Secure the hanger studs to a wall, press your insulating material onto the spikes, then follow up with washers (required, sold separately) to keep it all snug.

Base plates are made from galvanized C1008 steel. They have a minimum Rockwell hardness of B85, but are not rated for tensile strength.

Use ***self-adhesive hanger studs*** for interior, metal surfaces. The peel-off adhesive backing makes installation quick and easy. Adhesive is reliable at temperatures from 0° to +140° F.

Install ***plain hanger studs*** using adhesive (sold separately) or a MIG welder.

Adhesive is compliant under all state VOC rules in effect on January 1, 2012, except in California, Connecticut, Delaware, Maine, Maryland, New Jersey, New York, Pennsylvania, Rhode Island, and Northern Virginia. Reliable at temperatures from −30° to +250° F. *Note:* Apply adhesive at temperatures from −30° to +120° F.

Use an arbor press or similar pressure tool to press the stud head into a drilled or punched hole. Ribs hold the stud firmly in place, so it won't spin when you add a nut. All studs have a Class 2A thread fit. ***18-8 stainless steel*** may be mildly magnetic and is more corrosion resistant than ***zinc-plated steel***.

Wood-Screw-Threaded Studs

Known as headless hanger screws and dowel screws, these studs have threads that penetrate wood. They are not rated for tensile strength.

Type 1— One end is threaded for wood; the other is threaded to receive a nut. The nut-receiving end has a Class 1A thread fit. For nuts, see pages 3186-3187. For a driver tool, see 6197A on page 2835.

18-8 stainless steel studs have excellent corrosion resistance and may be mildly magnetic. They are not rated for hardness. *Zinc-plated steel* studs are made from low-strength C1006-C1010 steel. They have a minimum Rockwell hardness of B80.

Type 2— Both ends are threaded for wood. Studs are made from plain low-strength C1006-C1010 steel and have a minimum Rockwell hardness of B70.

Metric Type 1— Like the Type 1 studs above, one end is threaded for wood; the other is threaded to receive a nut. The nut-receiving end has a combination drive that accepts both Phillips and slotted blade drivers. Studs are made from Type 316 stainless steel, which may be mildly magnetic and contains molybdenum for resistance to chemicals and solvents. All have a Class 6g thread fit. For nuts, see pages 3193-3194.

About General Purpose Acme Products

General purpose Acme products have threads that are broader, stronger, and more square than standard V-shaped threads, so they're better for quick threading and carrying loads.

Acme threaded items are great for frequent assembly and disassembly, as well as projects subject to dirt and debris. They're used in highway construction and screw presses, and also as hanger rods, adjusting screws, and scaffold-leveling screws.

General purpose Acme threaded products have a Class 2G thread fit, which is looser than the Class 2C thread fit of our precision Acme threaded products.

Precision Acme rods come with multiple speed ratios to provide faster nut travel. Find them—and other precision Acme products—on pages 1107-1110.

Medium- and Low-Strength Steel General Purpose Acme Studs and Rods

All are right-hand threaded. Length is measured from end to end.

Grade B7 alloy steel studs and rods are made from plain 4140 alloy steel that meets ASTM A193. They have a maximum Rockwell hardness of C35, and minimum tensile strength of 125,000 psi.

Zinc-plated steel studs and rods offer good rust resistance and meet ASTM A108. They have a minimum Rockwell hardness of B70 and are not rated for tensile strength.

Plain steel studs and rods are similar to Grade 2 low-strength steel and meet ASTM A108. They have a minimum Rockwell hardness of B70 and are not rated for tensile strength.

Also Available: 12-ft. long (right-hand threaded) Acme rods in sizes marked with a ▲. Please ask for 93410A600 for Grade B7 alloy steel and 98935A800 for plain steel; then specify Acme size.

Also Available: Left-hand threaded Grade B7 alloy steel and plain steel rods in 3-ft. and 6-ft. lengths. Please ask for 93410A500 for Grade B7 alloy steel and 98935A400 for plain steel; then specify Acme size and length.

For information about general purpose Acme products, see page 3181.

Stainless Steel General Purpose Acme Studs and Rods

Our stainless steel Acme studs and rods have a Class 2G thread fit, maximum Rockwell hardness of B100 (unless noted), and are not rated for tensile strength. Length is measured from end to end.

Type 316 stainless steel meets ASTM A193 Grade B8M. It's more corrosion resistant than 18-8 stainless steel and contains molybdenum, which increases corrosion resistance to chlorides and sulfates. It may be mildly magnetic.

18-8 stainless steel offers excellent corrosion resistance and may be mildly magnetic.

Also Available: 12-ft. long 18-8 stainless steel (right-hand threaded) Acme rods in sizes marked with a ♠. Please ask for 95061A700 and specify Acme size.

Also Available: Left-hand threaded 18-8 stainless steel rods in 3-ft. and 6-ft. lengths. Please ask for 95061A400 and specify Acme size and length.

★ Not rated for hardness.

General Purpose Acme Hex Nuts

Use these nuts with general purpose Acme threaded rods. They have a Class 2G thread fit but are not rated for tensile strength.

18-8 stainless steel nuts offer excellent corrosion resistance and may be slightly magnetic. They're not rated for hardness.

Plain steel nuts are made from low-strength steel and have a minimum Rockwell hardness of B75.

Zinc-plated steel nuts are made from low-strength steel with a zinc plating for enhanced corrosion resistance. They have a Rockwell hardness of B75.

Alloy 360 brass nuts are made from brass that meets ASTM B16, is nonmagnetic, and provides good corrosion resistance. They have a Rockwell hardness of B75.

Also Available: Left-hand threaded general purpose Acme hex nuts. For 18-8 stainless steel, please ask for 95066A555; for plain steel, ask for 91808A200; for zinc-plated steel, ask for 98948A110; and for Alloy 360 brass, ask for 95155A300; then specify Acme size.

For information about general purpose Acme products, see page 3181.

General Purpose Acme Cylinder Nuts

Use to transmit linear motion, as a spacer, or as a bearing. All are machinable and have a Class 2G thread fit.

Gray Iron—Nuts are not rated for hardness.

Bronze—Meets ASTM B505, Grade 932. Nuts are not rated for hardness.

Brass—Made of Alloy 360 brass that meets ASTM B16. Nuts have a minimum Rockwell hardness of B55.

Also Available: Left-hand threaded general purpose Acme cylinder nuts in the sizes marked with a ★. Please ask for 95080A400 for gray iron; 95090A500 for bronze; and 95100A600 for brass; then specify Acme size.

General Purpose Acme Square Nuts

Made from brass that meets ASTM B16, these low-friction nuts travel quickly along threaded rod. All have a Class 2G thread fit and min. Rockwell hardness of B55.

Also Available: Left-hand threaded brass Acme square nuts in the sizes listed below (unless noted). Please ask for 95270A500 and specify Acme size.

▲ Not available with left-hand threads.

General Purpose Acme Wing Nuts

With a wingspan of 9 1/2″, these nuts are easy to grip—even with greasy hands or thick welding gloves. Made from ductile cast iron. Class 2G thread fit. Min. Rockwell hardness is B72.

Flat Style—Body height is 1 1/8″; wing height is 5/8″.

Ball Style—Body height is 1″; wing height is 1/2″; ball diameter is 1 1/8″.

To Order: Please specify flat or ball style.

Metric General Purpose Acme Rods and Hex Nuts

Rods measure 2 meters end to end. They're made from black-oxide steel that meets ASTM A108. Thread fit is Class 7e. Min. Rockwell hardness is B70.

Hex nuts are made from plain steel. Thread fit is Class 7H. Not rated for hardness.

General Purpose Acme Coupling Nuts

Use to join two lengths of general purpose Acme threaded rods or studs. All nuts have a Class 2G thread fit. *Note:* Not for linear motion applications. Nuts will not run the length of most threaded rod without binding.

18-8 stainless steel nuts offer excellent corrosion resistance. May be mildly magnetic. Not rated for hardness. ***Plain steel*** nuts are made from low-strength steel. They have a min. Rockwell hardness of B75.

Also Available: Left-hand threaded plain steel Acme coupling nuts in the sizes listed below (unless noted). Please ask for 93026A300 and specify Acme size.

General Purpose Acme Flange Nuts

Mount these one-piece flanged nuts to walls and floors to support Acme threaded rod. The wide flange sustains heavy loads and is machinable, so you can drill holes for custom mounting.

Nuts are made from SAE 660 bronze, which is nonmagnetic and highly resistant to corrosion from salt water, gasses, and sewage. They have a Class 2G thread fit (unless noted) and are not rated for hardness.

Also Available: Left-hand threaded Acme flange nuts in the sizes listed below. Please ask for 95120A100 and specify Acme size.

♦ Class 2C thread fit.

About Nuts, Materials, and Finishes

Types of Nuts

- ***Hex nuts*** (pages 3186-3189 [inch] and 3193-3194 [metric]) are the most common nuts for general fastening applications. ***Heavy hex nuts*** (page 3190 [inch] and 3192 [metric]), though similar, are slightly taller and wider for added thread engagement and greater bearing surface.

- ***Thin hex nuts*** (pages 3191-3192 [inch] and page 3194 [metric]) are also known as jam nuts and half-height nuts. Often used in pairs, one can be "jammed" against the other to prevent loosening.

- ***Nylon-insert hex locknuts*** (page 3196) feature a nylon locking element that resists vibration when engaged on the threads of a mating part.

- ***Flex-top expanding hex locknuts*** (page 3198) have a slotted top that expands when tightened to resist loosening from vibration. They're stronger than nylon insert locknuts of the same size.

- ***Distorted-thread hex locknuts*** (page 3199) have deformed threads that create a vibration-resistant friction fit against mating threads. They cannot be reused.

- ***Flange hex nuts*** (page 3201) have a wide base that eliminates the need for a separate washer. ***Serrated-flange*** (page 3201) versions act like locknuts—biting into surfaces to resist loosening.

- ***Coupling nuts*** (page 3204) are also known as extension nuts. They're commonly used to join lengths of threaded rod or in spacing applications with leveling feet or jig fixtures.

- ***Acorn nuts*** (page 3206) have a dome that covers and protects exposed threads while adding a finished appearance.

- ***Wing nuts*** (page 3207) are designed to be tightened or loosened by hand so you won't need tools to make adjustments.

- ***Thumb nuts*** (page 3209) are similar to wing nuts; they often have a knurled surface that makes them easy to turn with your fingers.

Measuring Widths and Heights

Steels

Extreme Strength *(Grade 9 Alloy Steel)*—Commonly used with Grade 9 cap screws. Stronger than Grade 8 steel. Minimum Rockwell hardness is C28.

High Strength *(Grade 8 Alloy Steel)*—Designed for use with Grade 8 hex head cap screws. Minimum Rockwell hardness is C24 (unless noted).

Metric High Strength *(Class 10 Alloy Steel)*—Typically used with Grade 10.9 screws. Equivalent to Grade 8 steel. Minimum Rockwell hardness is C25 (unless noted).

Medium Strength *(Grade 5 Steel)*—Commonly used with Grade 5 hex head cap screws. Not rated for hardness (unless noted).

Metric Medium Strength *(Class 8 Steel)*—Used with Grade 8.8 screws. Equivalent to Grade 5 steel. Minimum Rockwell hardness is B80 (unless noted).

Low Strength *(Grade 2 Steel)*—Commonly used with Grade 2 steel or ASTM A307 hex head cap screws. Not rated for hardness.

Low-Strength General Purpose Steel—Frequently used for general purpose machine screw applications. Minimum Rockwell hardness is B55 (unless noted).

Metric Low-Strength General Purpose Steel—*(Class 4, Class 5, Class 5.8, and Class 6)*—Comparable to low-strength steel. Classes 4 and 6 have a minimum Rockwell hardness of B75 (unless noted). Classes 5 and 5.8 are not rated for hardness.

Case-Hardened Steel—Wear resistant with a minimum surface hardness of Rockwell C32.

Stainless Steels

Super Corrosion Resistant *(Type 316 Stainless Steel)*—Sometimes referred to as Grade A4 stainless steel for metric fasteners, this material contains molybdenum for better corrosion resistance than 18-8 stainless steel. Minimum Rockwell hardness is B55 (unless noted).

General Purpose *(18-8 Stainless Steel)*—Sometimes referred to as Grade A2 stainless steel for metric fasteners, this material offers excellent corrosion resistance. Contains approximately 18% chromium and 8% nickel. May be mildly magnetic. Minimum Rockwell hardness is B55 (unless noted).

Wear Resistant *(Type 410 Stainless Steel)*—Magnetic and stronger than Type 316 and 18-8 stainless steel. Use in mildly corrosive environments, such as those with steam and weak acids. Not rated for hardness.

High-Strength Wear Resistant *(17-4 PH Stainless Steel)*—Combines the high strength of hardened alloy steel with excellent corrosion resistance that's similar to 18-8 stainless steel. Minimum Rockwell hardness is C28.

Very High Strength *(A286 Super Alloy)*—Iron-based. Contains 26% nickel and 15% chromium for the strength of alloy steel with corrosion resistance similar to 18-8 stainless steel. Minimum Rockwell hardness is C22 (unless noted).

Acid Resistant *(Alloy 20 Stainless Steel)*—Also known as Carpenter 20, this alloy is the most resistant to pitting and corrosion cracking from sulfuric acid. May be slightly magnetic. Minimum Rockwell hardness is B85.

Other Materials

Lightweight Aluminum—Aluminum has the strength of mild steel at one-third the weight. It's also corrosion resistant and nonmagnetic. Minimum Rockwell hardness is B40 (unless noted).

Brass—Made from approximately two-thirds copper and one-third zinc, brass is resistant to rust and mild atmospheric corrosion. It's nonmagnetic, durable, corrosion resistant, and electrically conductive. Minimum Rockwell hardness is B44.

High-Strength High-Temperature Nickel Alloy *(Hastelloy C276)*—This nonmagnetic alloy is resistant to chemical corrosion and stress-corrosion cracking. It's made from approximately 55% nickel, 16% chromium, and 16% molybdenum and has a minimum Rockwell hardness of C20 (unless noted).

Saltwater-Resistant Nickel-Copper Alloy 400—Also known as Monel. Stronger than brass and resistant to heat and corrosion, especially in salty and brackish water. Slightly magnetic, it's made from approximately 65% nickel and 30% copper. Minimum Rockwell hardness is B75 (unless noted).

Nylon 6/6—Very economical, nylon is the most common plastic fastener material. It's nonconductive, and resistant to chemicals and solvents (except mineral acids). It absorbs moisture, which can affect dimensions and other properties. Not rated for hardness.

Silicon Bronze—Made from approximately 95% copper with silicon for added strength, silicon bronze is nonmagnetic and more resistant to corrosion caused by salt water, gases, and sewage than brass. Minimum Rockwell hardness is B60.

Super-Corrosion-Resistant Titanium—Made from commercial Grade 2 titanium, this material is extremely resistant to rust, salt water, and many chemicals and acids. It meets ASTM B348 and is not rated for hardness.

Zinc Alloy—Typically used to cast intricate shapes. Offers good corrosion resistance. Not rated for hardness.

Coatings and Finishes

Ultra Coat—Also known as armorcoat, this silver-gray polymer coating adds 1000 hours of salt spray resistance and offers better corrosion resistance than zinc, hot-dipped galvanized, and cadmium platings.

Black Luster—Durable and attractive, this semigloss coating adds 500 hours of salt spray resistance.

Cadmium Plated—Provides excellent rust and weather resistance and adds lubricity.

Hot-Dipped Galvanized—Adds excellent protection against rust, weather, and corrosion.

Zinc and Zinc Yellow-Chromate Plated—Provide good to excellent rust and weather resistance.

Nickel Plated—Often added as a decorative finish; it provides fair rust and weather resistance.

Black Oxide—Provides mild rust resistance and some lubricity.

High-Visibility Blue—A coating used on some metric nuts to make them easy to distinguish from inch sizes.

Machine Screw Hex Nuts

Often used on machine screws and threaded rods, and great for tight spaces. Top of nut is flat and has chamfered corners; bottom may be flat or chamfered. Nuts have a Class 2B thread fit and dimensions that meet ANSI/ASME B18.6.3.

Zinc-plated steel nuts are not rated for hardness.

700-Piece Assortments

Nuts have a Class 2B thread fit. Furnished in an 11″ Lg. × 6 3/4″ Wd. × 1 3/4″ Dp. compartmented plastic case with lid chart.

Zinc-plated steel nuts meet ANSI/ASME B18.6.3. ***18-8 stainless steel*** nut dimensions meet ANSI/ASME B18.6.3.

Military Specification Stainless Steel Machine Screw Hex Nuts

Designed to meet stringent military specifications, these nuts are made from 300 series stainless steel. They may be mildly magnetic and are not rated for hardness. Each is passivated (treated with nitric acid to protect against oxidation and corrosion) to meet QQ-P-35 and meets MS 35649 and FF-N-836 (unless noted). All nuts have a Class 2B thread fit.

● Not rated for hardness. ♣ Does not meet ANSI/ASME B18.2.2. ★ Dimensions meet ANSI/ASME B18.6.3.

Hex Nut Assortments

Our handy 90-piece assortments contain the most common nut sizes. All nuts have a Class 2B thread fit and dimensions that meet ANSI/ASME B18.2.2. They come furnished in an 8¼″ Lg. × 4½″ Wd. × 1⅜″ Dp. compartmented plastic case with lid chart.

Extreme-Strength Hex Nuts—Grade 9

Heavy Nut

20% stronger than Grade 8 nuts, Grade 9 nuts handle high-strength applications. Also known as L9 nuts, they're made from Grade 9 alloy steel. All have a cadmium yellow-chromate plating and a Class 2B thread fit.

Choose from standard ***heavy nuts*** and ***oval locknuts***, which resist vibration thanks to an oval-shaped threaded area that locks them in place.

Military Specification Hex Nuts

Made to strict military specifications, all of these nuts have a Class 2B thread fit and meet FF-N-836. Additionally, ***300 series stainless steel*** nuts are passivated (treated with nitric acid to protect against oxidation and corrosion) to meet QQ-P-35, may be mildly magnetic, and are not rated for hardness.

Plastic Hex Nuts

Black Nylon 6/6

Lightweight alternatives to metal hex nuts, our plastic nuts have a Class 2B thread fit and are not rated for hardness.

Nylon 6/6—Nylon is not only the most popular choice for plastic fasteners, it's economical as well. Nonconductive and resistant to most solvents and oils, it has a temperature range of –40° to +185° F. *Note:* Nylon absorbs moisture which can affect dimensions and other properties. **To Order:** Please specify black or off-white.

Also Available: Glass-filled nylon nuts in sizes marked with a ★. Stronger than nylon 6/6 nuts, they have a temperature range of –40° to +230° F. Please ask for 90387A300 and specify thread size.

Acetal—More resistant than nylon to wear, gasoline, solvents, and other neutral chemicals, acetal resists moisture absorption, so it's also less susceptible to dimensional changes. Temperature range is –40° to +210° F. Color is off-white.

Fiberglass—Made from polyurethane reinforced with glass fibers, this material is stronger than nylon and resists many acids, solvents, salt water, and oils. Maximum temperature is +150° F. Color is gray.

PVC—Resistant to acids, alkalies, salt solutions, and alcohols. Maximum temperature is +120° F. Color is gray.

PTFE—Made from the lowest friction plastic we offer, PTFE nuts resist seizing and are the easiest to thread. Impervious to moisture and chemicals, they withstand temperatures up to +500° F. Color is white.

PEEK—An excellent electrical insulator, PEEK is perfect for electrical applications. It's stable in hostile environments and withstands water and steam without loss of physical properties. Maximum temperature is +599° F. Color is brown.

Also Available: Polypropylene nuts in sizes marked with a ●. They're chemical resistant and have a temperature range of –20° to +212° F. Please ask for 96169A400 and specify thread size.

Polycarbonate—This tough material is extremely impact resistant and does not absorb moisture. Not rated for temperature. Color is clear.

Self-Sealing Hex Nuts

Prevent leaks at pressures up to 6000 psi. When nuts are tightened, a silicone O-ring seals along the threads and the contact surface. The O-ring withstands temperatures of −160° to +500° F.

All nuts have a Class 2B thread fit. They're also vibration resistant, reusable, and UL recognized.

Heavy Hex Structural Nuts for ASTM A325 Bolts

Recommended for use with ASTM A325 bolts in structural joints. All have a Class 2B thread fit and meet ASTM A563. Dimensions meet ANSI/ASME B18.2.2.

Grade DH nuts are marked with DH. With a min. Rockwell hardness of C24, they're harder than Grade C nuts. ***Grade C*** nuts are marked with three curved lines. They have a min. Rockwell hardness of B78.

Heavy Hex Nuts

Wide and thick for better thread engagement and more bearing surface than standard hex nuts. Class 2B thread fit. Dimensions meet ANSI/ASME B18.2.2.

Also Available: Left-hand-threaded heavy hex nuts in thread sizes marked with a ★. Grade 5 steel. Please ask for 90570A700 and specify thread size.

Nut Torque Tightening Guide

Use this handy guide to reference torque requirements for inch nuts in 1/4″ to 4″ sizes and metric nuts in M4 to M100 sizes. The guide has 56 pages and measures 3 1/2″ Wd. × 5 3/4″ Ht.

90662A050 ..... **Each** $7.18

Heavy Hex Nuts for High-Pressure Applications—ASTM A194

Designed to meet ASTM A194 for high-pressure service in applications such as pressure vessels, valves, flanges, and fittings. Taller and wider than standard hex nuts, they provide more thread engagement and bearing surface. All have a Class 2B thread fit. Dimensions meet ANSI/ASME B18.2.2 (unless noted).

Grade 2H nuts are marked with 2H and are not rated for hardness. ***Grade 7*** nuts are marked with 7; min. Rockwell hardness is C24. ***Grade 8*** nuts are marked with 8 or 8B; min. Rockwell hardness is B60.

Also Available: Grade 8M Type 316 stainless steel nuts in thread sizes marked with a ●. Please ask for 97619A100 and specify thread size.

♣ Does not meet ANSI/ASME B18.2.2.

For information about nuts, materials, and finishes, see page 3184.

Thin Hex Nuts

Also known as jam nuts and half-height nuts; perfect in tight spaces. Often used in pairs, one is "jammed" against the other to prevent loosening. All have a Class 2B thread fit. Sizes 1½" and smaller have dimensions that meet ANSI/ASME B18.2.2 (unless noted).

Nylon 6/6 nuts have a temperature range of –40° to +185° F. **To Order:** Please specify black or off-white.

Military Specification Stainless Steel Thin Hex Nuts

Designed to meet stringent military specifications, these nuts are also known as jam nuts and half-height nuts. Made from 300 series stainless steel, they may be mildly magnetic and are not rated for hardness. All have a Class 2B thread fit and meet MS 35691 and FF-N-836.

Extra-Wide Thin Hex Nuts

Also known as heavy jam nuts, these nuts provide the same width and bearing surface as the heavy hex nuts on page 3190, but are not as thick. All nuts have a Class 2B thread fit and dimensions that meet ANSI/ASME B18.2.2 (unless noted).

Grade 2H nuts are not rated for hardness. They meet ASTM A194 for high-pressure applications and are marked with 2H to indicate grade.

Metric Heavy Hex Nuts

Because they're slightly thicker than standard hex nuts, these nuts have added strength and better thread engagement. All have a Class 6H thread fit.

Zinc-plated steel nuts meet ISO 4033. Thread sizes M2-M5 are made from Class 6 steel; sizes M6-M30 are made from Class 8 steel.

Black-finish Grade 2H steel nuts meet DIN 6915 and ASTM A194 for high-pressure applications and are marked with 2H to indicate grade. They are not rated for hardness.

Metric Hex Nuts—DIN 934

All of these metric hex nuts have a Class 6H thread fit and meet DIN 934, except those made from Bumax 88 stainless steel and nylon 6/6.

Zinc-plated steel and ***plain steel*** nuts in thread sizes M1.6-M5 are made from Class 6 steel; sizes M6-M36 are made from Class 8 steel. ***Bumax 88 stainless steel*** nuts have the strength of Class 8 steel combined with the corrosion resistance of Type 316 stainless steel, plus they're acid resistant, meet ISO 4032, and have a minimum Rockwell hardness of C28.

Nylon 6/6 nuts have a temperature range of –40° to +185° F. **To Order:** Please specify black or off-white.

Metric Thin Hex Nuts—DIN 439B

Also known as half-height nuts, these fasteners are perfect for tight spaces. Frequently used in pairs, they're sometimes called jam nuts because one is "jammed" against the other to prevent loosening. All nuts have a Class 6H thread fit.

Square Nuts

Square nuts have a large bearing surface and plenty of surface area for your wrench to grip. Choose from flat top and round top styles. Nuts with a flat top are also known as machine screw square nuts. Inch size nuts have a Class 2B thread fit; metric size nuts have a Class 7H thread fit and meet DIN 557.

Flat-top nuts (except those made from fiberglass) and ***round-top*** nuts made from 18-8 stainless steel have dimensions that meet ANSI/ASME B18.6.3. All other ***round-top*** nuts have dimensions that meet ANSI/ASME B18.2.2.

Fiberglass nuts are gray.

Concave Square Locknuts

Also known as utility-pole nuts, these hot-dipped galvanized steel nuts have a cupped shape with corners that bite into soft materials to hold securely. The cupped shape assures a flush fit against round-top square nuts and that they'll resist loosening when jammed against flat-top square nuts. Locknuts are not rated for thread fit or hardness.

Nylon-Insert Heavy Hex Locknuts

To provide extra strength and greater thread engagement, these reusable locknuts are thicker than standard nylon-insert locknuts. When fully tightened, the nylon insert provides vibration resistance and prevents loosening—without damaging mating threads. Each locknut has a Class 2B thread fit and is reliable at temperatures up to 250° F.

Nylon-Insert Extra-Wide Thin Hex Locknuts

These reusable locknuts have an extra-wide bearing surface and a nylon insert that provides vibration resistance and prevents loosening—without damaging mating threads. They have a Class 2B thread fit and are reliable at temperatures up to 250° F.

Black-phosphate Grade C steel nuts have a minimum Rockwell hardness of C25. Grade C steel is equivalent to high-strength alloy steel (Grade 8).

Nylon-Insert Hex Locknuts

The nylon insert provides vibration resistance and prevents loosening—without damaging mating threads. Nuts are reusable. Each has a Class 2B thread fit and is reliable at temperatures up to 250° F (unless noted).

Black-luster-coated Grade 2 steel nuts are resistant to 500 hours of salt spray per ASTM B117.

Military Specification Nylon-Insert Hex Locknuts

Made to precise military specifications, these locknuts have a nylon insert that provides vibration resistance and prevents loosening—without damaging mating threads. ***Hex*** meet MS 21044; ***thin hex*** meet MS 21083. All have a Class 3B thread fit. They're reliable at temperatures up to 250° F but are not rated for hardness.

18-8 stainless steel locknuts are passivated (treated with nitric acid to protect against oxidation and corrosion) to meet QQ-P-35.

Nylon-Insert Thin Hex Locknuts

Also known as jam locknuts, these reusable locknuts are thinner than standard nylon-insert hex locknuts. They can be used individually where clearance is limited or in conjunction with a regular locknut for extra resistance to loosening from vibration. All have a Class 2B thread fit and are reliable at temperatures up to 225° F.

Black-luster-coated Grade 2 steel nuts are resistant to 500 hours of salt spray per ASTM B117.

♠ Zinc yellow-chromate plated. ■ Not rated for hardness.

Metric Nylon-Insert Hex Locknuts—DIN 985

The metric version of our popular nylon-insert hex locknuts, these nuts resist loosening from vibration and can be reused. They meet DIN 985, have a Class 6H thread fit, and are reliable at temperatures up to 248° F.

Flex-Top Expanding Hex Locknuts

Hex

Heavy Hex

Thin Hex

Extra-Wide Thin Hex

Stronger than nylon-insert locknuts of the same size, these nuts are made from a single piece of metal. Also known as Flexloc nuts, they have a slotted top that expands when the nuts are tightened—locking them in place and providing superior vibration resistance. Nuts are not rated for hardness. Inch sizes have a Class 2B thread fit; metric have a Class 6H thread fit. ***Cadmium-plated steel*** nuts are made from low strength steel.

Also Available: Military specification flex-top expanding hex locknuts that meet MS 21045 and National Aircraft Standard (NASM) 25027. Made from cadmium yellow-chromate plated steel. Please ask for 99638A990 and specify thread size.

Nylon-Insert Hex Flange Locknuts

No need to search for a separate washer, these vibration-resistant locknuts provide the extra bearing surface you need and they're great for covering oversized holes. They have a Class 2B thread fit, are reliable at temperatures up to 250° F, and are rated for maximum Rockwell hardness of C28, unless noted.

You can pair ***zinc yellow-chromate plated Grade G steel*** nuts with high-strength Grade 8 hex head cap screws.

Zinc-plated Grade F steel nuts are made from steel equivalent to Grade 5 steel.

Also Available: Metric zinc-plated Class 8 steel nylon-insert hex flange locknuts. Nuts meet DIN 6926 and are reliable at temperatures up to 248° F. Please ask for 92461A100 and specify thread size.

★ Not rated for Rockwell hardness.

Nylon Hex Locknuts

These off-white nylon 6/6 nuts form threads as they're tightened. Use them in light duty applications that require vibration resistance. Temperature range is –40° to +185° F.

Self-locking nuts are partially tapped with a locking thread; the balance of the nut is tapped as the nuts are tightened. ***Self-threading*** nuts are not tapped; threads form as the nuts are tightened.

Left-Hand Distorted-Thread Hex Locknuts

Designed to tighten in a counterclockwise direction, these locknuts have a slight indent in the center that distorts the threads enough to cause a vibration-resistant friction grip against mating threads. Sometimes called two-way locknuts because they can be threaded on from either end, they're made from zinc-plated Grade 8 steel and have a Class 2B thread fit. Not reusable.

Distorted-Thread Hex Locknuts

Also known as all-metal and Stover locknuts, these one-piece nuts feature distorted threads that create a vibration-resistant friction fit—so the nuts stay put. Reusable up to three times.

Oval Lock—One end has a complete thread distorted into an oval shape. Versions *with flange* cover oversized holes. Grade G have a min. Rockwell hardness of C24; Grade C have a min. Rockwell hardness of C26. Both grades are equivalent to high-strength alloy steel (Grade 8).

Toplock—Like oval locknuts, but with threads deformed in two or three separate areas.

Centerlock—Also known as two-way locknuts, these nuts are compressed in the center. This allows them to be threaded on from either end.

Oval Lock with Flange — *Oval Lock with Conical Top* — *Toplock* — *Centerlock*

Distorted-Thread Steel-Insert Hex Locknuts

Hex *Heavy Hex* *Thin Hex*

If severe vibration is the problem, these reusable, all-steel locknuts are your solution. Designed in two pieces; the elliptically-shaped locking insert isolates the vibration allowing the separate nut body to carry the load without coming loose. They're stronger and more vibration resistant than expanding hex locknuts, and they stand up to chemicals and extreme temperatures better than nuts that rely on thread adhesives for holding strength. Inch sizes have a Class 2B thread fit; metric sizes have a Class 6H thread fit.

Military Specification Distorted-Thread Hex Locknuts for High Temperatures

Also known as jet nuts, these nuts are made to exacting military standards. The thread area is crimped into an oval shape that provides a vibration-resistant friction grip against mating threads. Nuts have a flange that adds clamping strength and scaled down proportions that make them ideal in tight spaces. All have a Class 3B thread fit and are not rated for hardness.

Cadmium-plated steel nuts meet MS 21042 and withstand temperatures up to 450° F. ***Silver-plated A286 super alloy*** nuts meet MS 21043 and withstand temperatures up to 800° F.

Machine Screw Hex Nuts with Lock Washer

With Tooth Washer *With Conical Washer*

To make your job a little bit easier, these nuts come with a free-spinning lock washer already attached. Also known as Keps and K-lock nuts, inch sizes have a Class 2B thread fit; metric sizes have a Class 6H thread fit.

Nuts ***with tooth washer*** resist vibration when the washer teeth bite into the surface they're tightened against. Nuts ***with conical washer*** have a smooth rim that's less likely to scratch soft materials. Tension holds them tight.

High-Strength 12-Point Flange Nuts

Stronger than Grade 8 steel nuts, these one-piece nuts are made from chrome-moly alloy steel. They feature a 12-point drive that provides more contact points than a hex head to handle more tightening torque. Each has a smooth, nonmarring flange that distributes the load for maximum holding power. All have a black-oxide finish, a Class 3B thread fit, and a minimum Rockwell hardness of C34.

Also Available: A286 super alloy 12-point flange nuts in sizes marked with a ●. Please ask for 90997A660 and specify thread size.

Serrated-Flange Hex Locknuts

Armed with teeth-like serrations, these one-piece locknuts bite into surfaces to resist vibration. Dimensions meet IFI-145. Inch sizes have a Class 2B thread fit; metric sizes have a Class 6H thread fit.

Zinc-plated Grade 2 steel nuts have a maximum Rockwell hardness of C40.

Easy-On Flange Hex Locknuts

Just spin them on; these locknuts don't require tedious tightening with a wrench—great news if you're working with a long bolt or stud. Unlike distorted-thread and nylon-insert locknuts that lock by interfering with the thread fit, these reusable one-piece locknuts have a cupped, non-marring flange that does the locking. All have a Class 2B thread fit.

Two-Piece Thread-Clamping Locknuts

Also known as drake-style locknuts, these reusable, two-piece locknuts have greater holding power in high-vibration applications than expanding and nylon-insert locknuts. To use, first tighten the lower nut, and then the mating upper nut. The flexible slotted crown on the lower nut compresses and clamps the nut to your bolt or stud. Ideal for use with Grade 5 and B7 bolts and studs. Nuts are made from steel and have a Class 2B thread fit.

Slotted Hex Nuts

A

B

To lock these nuts, insert a cotter pin or safety wire through the slots and through a drilled hole in your fastener. Inch sizes have a Class 2B thread fit and dimensions that meet ANSI/ASME B18.2.2 (except those made from 18-8 stainless steel). Metric sizes have a Class 7H thread fit and meet DIN 935.

For safety wire, see 8860K14 on page 3731. For wire twisting pliers, see page 2757. For cotter pins, see page 3356.

Safety Wire Locking Nut Retainers

Prevent nuts and bolts from working loose, even under extreme vibration. Just insert a retainer between the nut (or bolt head) and the mating surface, then attach safety wire. Made from spring steel.

For safety wire, see 8860K14 on page 3731. For wire twisting pliers, see page 2757. For cotter pins, see page 3356.

Twist-On Quick-Threading Nuts

Threading nuts up a long length of rod can be a nuisance. These nuts swivel open so you can put them right where you need them, then simply twist them closed. Nuts are reusable and they won't damage threads. Inch sizes have a Class 2B thread fit; metric sizes have a Class 6H thread fit.

Push-Button Quick-Threading Nuts

Hex

Hex with Flange

Round with Knurl

Making adjustments couldn't be easier. Just push the button and slide the nut where you need it. When you release the button, the nut is once again engaged and ready to tighten. Nuts are made from black-oxide case-hardened steel. All have a Class 2B thread fit.

Tamper-Resistant Nuts

Prevent the theft of your property. These tamper-resistant nuts are frequently used to secure signs, outdoor lighting, and displays. Use with carriage screws (see pages 3020-3021) or in places where screw heads are inaccessible.

All except breakaway nuts are reusable. All nuts have a Class 2B thread fit, except spanner nuts which have a Class G3 thread fit.

Sloped Nuts

With a wide base, these nuts are ideal for securing larger items. They're made from zinc yellow-chromate plated steel and are not rated for hardness.

M10 (1.5 mm)	1.05"	0.23"	5	98789A230	5.26

Nonremovable Breakaway Nuts

Once installed, these nuts cannot be removed, so they're perfect for securing valuable equipment. After installation, the hex part of the nut breaks away, leaving only the nonremovable cone. Install with a standard wrench. Made from corrosion-resistant aluminum alloy 2011-T3.

Serrated-Edge Driver ..... 98577A200 Each $62.00

High Hex Nuts

The long length makes wrench-tightening easier, which is especially helpful in spaces where access is difficult. Each nut is fully threaded, has a Class 2B thread fit, and is made from Grade 8 steel (except thread size 3/8"-24, which is made from Grade 5 steel). Materials meet SAE J995; dimensions meet SAE J482.

Coupling Nuts

Also known as extension nuts, you can use these coupling nuts to join lengths of threaded rod or in spacing applications with leveling feet or jig fixtures.

Inch Sizes— Nuts shorter than 4″ are fully threaded; nuts 4″ and longer are partially threaded on both ends. All have a Class 2B thread fit except hot-dipped galvanized nuts, which are tapped oversized. ***Grade 2H steel*** nuts meet ASTM A194 and have a minimum Rockwell hardness of C24.

Metric Sizes— All are fully threaded and have a Class 6H thread fit.

Note: If you can't find the coupling nut you need, see our Female Threaded Hex Standoffs on page 3258. They're used in spacing and joining applications, and are available in sizes 2-56 to ¼″-20 in a variety of widths and lengths.

Reducing Coupling Nuts

Also known as thread adapters, you can use reducing coupling nuts to connect different sizes of threaded rod. Each end is right-hand threaded to a depth at least equal to the screw diameter it accommodates. All nuts have a Class 2B thread fit.

★ Made from zinc-plated Grade 5 steel.

Right- and Left-Hand Threaded Coupling Nuts

Join two lengths of rod with one turn of a nut—these nuts have right-hand threads in one half and left-hand threads in the other. They're made from zinc-plated Grade 2 steel and have a Class 2B thread fit.

Thread Size	Lg.	Wd.		Each 1-9	Each 10-Up

1″-8	7″	1 5/8″	94280A135	40.69	34.44

High-Crown Acorn Nuts

Taller and wider than standard-size acorn nuts, high-crown nuts are designed to cover the exposed ends of extra-long studs and screws. All have a Class 2B thread fit.

Thread Size	Wd.	Ht.	Thread Depth	Black-Oxide Case-Hardened Steel	Each	18-8 Stainless Steel	Each
5/16″-18	5/8″	5/8″	3/8″	90790A185	$4.58	92040A110	$5.50

1/2″-13	3/4″	1/2″	94301A160	6.15

Coupling Nuts with Sight Hole

Don't guess at thread engagement—the sight hole in the center of the nut lets you peek to see how far in a rod has been threaded. Nuts are fully threaded. They're made from zinc-plated Grade 2 steel, meet IFI-128, and have a Class 2B thread fit.

Thread Size	Lg.	Wd.	Sight Hole Size		Each 1-9	Each 10-Up

Protective Cap Hex Nuts

The attractive black cap covers exposed threads and acts as a leak-resistant seal. It seals internal and external pressures up to 80 psi and remains effective at temperatures up to 250° F.

Nuts are made from zinc-plated Grade 2 steel (unless noted) and have a Class 2B thread fit. Caps are made from nylon 6/6.

★ Made from zinc-plated Grade 5 steel.

Self-Locking Acorn Nuts

To resist vibrating loose, these nuts have distorted threads in the hex area that create a tight, friction fit. Nuts are made from 18-8 stainless steel and have a Class 2B thread fit.

Acorn Nut Assortments

If you frequently use acorn nuts, you'll love these handy 200-piece assortments. All nuts have a Class 2B thread fit and come in a compartmented plastic case with lid chart.

Nickel-plated steel nuts come in an 8 1/4″ Lg. × 4 1/2″ Wd. × 1 3/8″ Dp. case.

18-8 stainless steel nuts come in an 11″ Lg. × 6 3/4″ Wd. × 1 3/4″ Dp. case.

18-8 Stainless Steel	91987A800	Each	$96.50

Acorn Nuts

Also known as cap nuts, acorn nuts provide a finished appearance by covering exposed threads. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit and meet DIN 1587 (unless noted).

Nylon 6/6 nuts are reliable at temperatures from −40° to +185° F. **To Order:** Please specify black or off-white.

♣ Does not meet DIN 1587. ● Height is 20.5 mm.

Wing Nuts

Tighten or loosen by hand—no tools required. Great for frequent adjustments. Each wing nut has a Class 2B thread fit.

Nylon 6/6 nuts have temperature range of –40° to +185° F. **To Order:** Please specify black or off-white.

● Made from zinc-plated iron. ♥ Made from plain iron.

Metric Wing Nuts

Designed for metric applications, these wing nuts meet DIN 315 (except those made from nylon 6/6) and have a Class 6H thread fit.

Nylon 6/6 nuts have a temperature range of –40° to +185° F. **To Order:** Please specify black or off-white.

Nylon-Insert Locking Wing Nuts

If you're worried about wing nuts vibrating loose, these have a nylon 6/6 insert that provides vibration resistance and is reliable at temperatures up to 250° F. Nuts are cast from zinc alloy and have a Class 2B thread fit.

98191A416 ..... Each $49.74

Heavy Duty Wing Nuts

Use these rugged oversized wing nuts to tackle tough jobs. All have a Class 2B thread fit.

Alloy steel nuts are cast from 8620 alloy steel and have a hammered finish. Stronger than 18-8 stainless steel nuts, they have a minimum Rockwell hardness of B100.

18-8 stainless steel nuts are cast and polished to a fine finish. They are not rated for hardness.

Blank nuts come without a threaded hole. You can custom machine them with a hole up to 3/4″ in diameter.

Tube Connecting Nuts

Use inside round or square steel tubing to create tee joints. Connectors consist of a zinc-plated 12L14 steel nut surrounded by two heat-treated spring steel retaining clips. The clips grip the sides of the tube and hold the nut ready to receive a screw or threaded rod. Nuts have a Class 2B thread fit. Connectors are not rated for hardness and are not reusable.

Rotating Flange Nuts

The nut rotates 360°, but the flat-bottom flange washer holds firm upon contact—so it won't spin and scratch your workpiece. The nut is made from steel with a black-oxide finish and has a minimum Rockwell hardness of C20. The flange is made from case-hardened steel with a black-oxide finish and has a minimum surface hardness of Rockwell C55.

Thumb Nuts

Like wing nuts, you need only your fingers to thread these nuts into position. Round thumb nuts ***(Styles 1-4)*** have knurls to prevent your fingers from slipping and hex shaped nuts ***(Style 5)*** accommodate a wrench so you can get them extra tight. Unless noted, all nuts are fully threaded. Inch sizes have a Class 2B thread fit; metric sizes have a Class 6H thread fit.

Nylatron nuts are wear resistant and reliable at temperatures up to 220° F. Color is black.

Acetal nuts have a threaded insert made from aluminum 6061-T6. They're wear resistant and reliable at temperatures up to 180° F. Color (excluding insert) is black.

For more information about nuts, materials, and finishes, see page 3184.

High-Torque Thumb Nuts

Four holes around the perimeter allow these reusable nuts to be easily tightened with any rod or pin that fits the hole size. Also known as check nuts or jam nuts, they're often used for jam locking in jig and fixture applications.

Black-oxide case-hardened steel nuts have a minimum surface hardness of Rockwell C48; ***18-8 stainless steel*** nuts have a minimum Rockwell hardness of B84.

Self-Leveling Flange Nuts with Washers

Also known as spherical collar nuts, the convex nut swivels against the concave surface of the washer to remain level against slightly uneven surfaces. All have a Class 2B thread fit.

Black-oxide case-hardened steel nuts are rust resistant and have a minimum surface hardness of Rockwell C55. ***18-8 stainless steel*** nuts offer excellent corrosion resistance and may be mildly magnetic. They are not rated for hardness.

♣ Flange diameter is 1 3/16″.

T-Slot Nuts

Designed to fit into T-slots in machine tool tables. Inch sizes have a Class 2B thread fit; metric sizes have a Class 6G thread fit. For more fixturing components, see page 2596.

Fully threaded nuts (also known as tapped-through nuts) are threaded all the way through so a stud can extend beyond the bottom. ***Partially threaded*** nuts keep studs from traveling past the bottom of the nut and causing damage to your work table.

Black-oxide case-hardened steel nuts are made from rust resistant case-hardened C1018 steel and have a minimum surface hardness of Rockwell C55. ***18-8 stainless steel*** nuts offer excellent corrosion resistance, may be mildly magnetic, and have a minimum Rockwell hardness of B80.

Hex Speed Nuts

Also known as palnuts, these reusable nuts can be used alone in light duty assemblies or along with an ordinary hex nut to ensure tightness in higher stress assemblies. They're made from spring steel and have a zinc plating (unless noted) for corrosion resistance. All have a Class 2B thread fit and a minimum Rockwell hardness of C36.

♠ Has a hot-dipped galvanized coating.

Flange Speed Nuts

For Threaded Screws and Studs

With a wide base, these reusable one-piece washer locknuts are a good choice to cover oversized holes. They're made from spring steel and have a zinc plating for rust resistance. Minimum Rockwell hardness is C41.

Nuts ***for threaded screws and studs*** have a single thread with a Class 2B thread fit. Nuts ***for unthreaded shafts*** cut their own threads.

Rectangular Speed Nuts

Also known as flat-style speed nuts, these nuts are often chosen as quicker, easier to thread alternatives to threaded nuts and lock washers. All are made from spring steel with a black-phosphate finish and have a minimum Rockwell hardness of C20 (unless noted).

Nuts ***for threaded screws and studs*** have a single thread with a Class 2B thread fit and are reusable. Nuts ***for sheet metal and thread-forming screws*** have a single thread and are reusable. Nuts ***for unthreaded shafts*** have no threads and are not reusable.

▲ Made from 18-8 stainless steel; not rated for hardness.

Push Nuts for Threaded Rods and Studs

Also known as bolt retainers, these push nuts slide easily over threads to securely hold fasteners in place. They're made from spring steel and are not reusable. Inch sizes have a black-phosphate finish and metric sizes are zinc plated (unless noted).

For optional installation drivers, see 93633A (sold separately on this page; driver numbers listed below).

Push Nuts for Unthreaded Shafts

Also known as push-on retainers, you can use these nuts on unthreaded rods, shafts, and axles to keep attachments firmly in place. They are not reusable.

Styles A and ***B*** are made from spring steel and have a minimum Rockwell hardness of C39. Inch sizes are zinc plated; metric sizes have a black finish (unless noted).

Style C are also known as grooveless retainers. They're made from 300 series stainless steel and have a minimum Rockwell hardness of C30.

For optional installation drivers, see 93633A (sold separately on this page; driver numbers listed below).

Cap Nuts for Unthreaded Shafts

Also known as axle caps, these nuts give axles and shafts a finished look. Just push them onto the end of a shaft and they're locked in place. All (except 97036A) are vibration resistant. Not reusable.

Black-luster coated spring steel nuts have a decorative black finish that's durable, corrosion resistant, and can withstand 500 hours of salt spray.

Nickel-plated steel nuts are also known as washer cap push nuts. They have a decorative silver finish.

Stainless steel nuts are made from Type 430 stainless steel with a 300 series stainless steel insert. They offer excellent corrosion resistance.

Plastic nuts are made from high-density black plastic with a spring-steel insert. They withstand temperatures of –97° to +152° F.

Electrical Panel Nuts

Hex Nut

Locking Nut

Round Nut

Also known as dress nuts, electrical panel nuts are designed for mounting common electrical switches (such as push-button switches and rotary output switches) into panel cutouts. Each has a Class 2B thread fit (unless noted).

Thread Types: NPS=National Pipe Straight Thread; NEF=National Extra Fine Thread; NS=National Special Thread; and NPSM=National Pipe Straight Mechanical Thread.

For more information about nuts, materials, and finishes, see page 3184.

No-Slip Clip-On Nuts

Standard

Tapped Hole

Wide Panel

Screws pass through both the top and bottom of these one-piece reusable nuts, so the nuts don't slip or turn as they're tightened down. Also known as U-style nuts, each is made from spring steel and has a black-phosphate finish, unless noted. All have a minimum Rockwell hardness of C20. Inch sizes for machine screws have a Class 2B thread fit; metric have a Class 6H thread fit.

Standard nuts are easy-to-install, single-thread speed nuts.

Wide panel nuts are single-thread speed nuts that accommodate a wide range of panel- and channel-edge thicknesses. They can also be used with tapping screws in service panel applications.

Tapped hole nuts are multiple-thread extruded nuts that are also known as fold-over nuts. They provide a tapped hole for high-strength fastening of sheet-metal components.

Clip-On Nuts

Snap these simple-to-use reusable nuts onto panels for a tight hold during blind assembly.

Styles 1 and ***2*** are often used on electric consoles. Also known as J-style clip-on speed nuts, they have a minimum Rockwell hardness of C20. Nuts *for machine screws* have a Class 2B thread fit.

Styles 3 and ***4*** offer the security and holding power of a multiple-thread nut so they're great for heavy duty applications. Also known as cage clip-on nuts, they have a minimum Rockwell hardness of C45.

Style 3 have a spring steel clip and a steel nut with a Class 2B thread fit.

Style 4 have a heat treated steel clip and a steel nut with a Class 3B thread fit. With an S-style shape, they have more bearing surface than J-style nuts.

♣ Zinc plated.

Easy-Align Clip-On Nuts

Also known as floating nuts, these nuts "float" within a retainer for easy alignment with off-center holes.

Square style clip-on nuts are designed to fit into square holes. Use your fingers or pliers to insert. Mounting legs expand to lock the fastener in place. Nuts for #6 to 1/4″ size screws fit into 11/32″ or 3/8″ square holes. Those for 5/16″ size screws fit into 15/32″ or 1/2″ square holes; and those for 3/8″ and 1/2″ screws fit into 15/32″, 1/2″, 37/64″, or 19/32″ square holes.

U-style and ***G-style*** clip-on nuts slide right onto the edge of a panel—no special tools required. G-style are commonly used for computer racks and shelves.

Zinc-plated steel nuts have a zinc-plated spring steel retainer and a minimum Rockwell hardness of C44. *18-8 stainless steel* nuts have a Type 301 stainless steel retainer and are not rated for hardness.

Flush-Mount Captive Nuts

Great where space is limited, loads are light, and panels are too thin to tap with threads. Install using an arbor press or similar pressure tool. They're made from 18-8 stainless steel and may be mildly magnetic. Each has a Class 2B thread fit and a minimum Rockwell hardness of B98.

Captive Nuts

Round Head Broach Style *Round Head Clinch Style*

Also known as insert nuts, these fasteners are well-suited for use in lightweight materials. To install, simply press the knurled end into a hole using an arbor press or similar pressure tool. The knurls cut into the panel to hold the nut in place. Inch sizes have a Class 2B thread fit (except nylon-insert locknuts which have a Class 3B thread fit); metric have a Class 6H thread fit. Nuts are not rated for hardness (unless noted).

Use ***broach style*** nuts in soft aluminum, polycarbonates, glass, epoxy, and resin laminates. Use ***clinch style*** nuts in sheet metal. ***Easy-align round head clinch style*** two-piece nuts (also called floating nuts) can freely move up to 0.030″—making alignment with mating holes and/or male threaded fasteners easier. ***Round head clinch style nylon-insert locknuts*** come with a nylon 6/6 insert that keeps screws from coming loose. Inserts are reliable up to 250° F.

Tin-plated steel nuts are good for soldering. *18-8 stainless steel* nuts provide excellent corrosion resistance and may be mildly magnetic. *Zinc-plated steel* nuts provide good corrosion resistance (metric sizes are case hardened to a minimum surface hardness of C52).

★ Round head, broach style. ♥ (C) dimension is 8.3 mm. ■ (C) dimension is 10.3 mm.

Weld Nuts

Designed for flat surfaces, each nut has a fully threaded hole through the base.

Round-base nuts have ample surface area for your weld; more than slab- and tab-base nuts provide. Nuts *with projections* have three weld nibs (also known as bosses) located on the barrel side.

Tab-base nuts have a smaller welding surface so they're perfect near edges, in narrow channels, and in square tubing. Nuts with a pilot have a low profile so they're a good choice for confined spaces. (The pilot guides them into position and shields threads from weld spatter.) Nuts *with offset pilot* allow you to position threads near edges and in corners. Nuts *with center pilot* are designed for bridging corners and depressions. Nuts *with center pilot and projections* have two weld nibs on the pilot side.

Steel nuts have a minimum Rockwell hardness of B50. Inch sizes have a Class 1B thread fit, except 94579A and 98001A, which have a Class 2B thread fit. Metric sizes have a Class 6H thread fit. ***18-8 stainless steel*** nuts have a minimum Rockwell hardness of B65 and may be mildly magnetic. Inch sizes have a Class 2B thread fit; metric have a Class 6H.

Weld Nuts with Holes

Weld, nail, screw, rivet, or mold these versatile nuts into place.

Style A have three holes to accept fasteners. They have a Class 1B thread fit.

Style B have three holes, plus three protrusions that add twist resistance and extra weld surface for a strong bond. They have a Class 1B thread fit.

Style C are drilled with multiple holes that allow glue or plastic to flow through. They have a Class 2B thread fit.

Plain steel nuts are made from C1006-C1008 steel. They have a minimum Rockwell hardness of B50.

Zinc yellow-chromate plated steel nuts resist rust. They're made from C1008 steel and have a minimum Rockwell hardness of B80.

Type 316 stainless steel nuts provide superior corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B95.

Weld Nuts with Projections

Projections add surface area so your weld results in a strong bond. Position nuts over pierced or drilled holes; each has a pilot that guides it into position and prevents welding spatter from getting into threads.

Square nuts have four projections for a strong weld on flat surfaces. ***Hex nuts*** have three projections that ensure a reliable weld, even on surfaces that aren't perfectly flat.

Steel nuts have a minimum Rockwell hardness of B70. Inch sizes have a Class 2B thread fit; metric have a Class 6H thread fit.

18-8 stainless steel nuts may be mildly magnetic and have a minimum Rockwell hardness of B94. Inch sizes have a Class 2B thread fit; metric have a Class 6G thread fit.

Easy-Align Weld Nuts

Also called bridge or floating weld nuts, these nuts float within a retainer to compensate for misalignment. Weld them to steel parts or punch holes in the flanges and secure them with rivets.

Nuts are made of plain or zinc-plated C1008-C1010 steel and have a min. Rockwell hardness of B40. Inch sizes have a Class 2B thread fit; metric have a Class 6H thread fit. Thread size is imprinted on flange.

Zinc-plated steel nuts have a rust-resistant aluminum 5052-H32 retainer; ***plain steel*** nuts have a C1008-C1010 steel retainer.

Tube-End Weld Nuts

Use these nuts to add threads to the ends of tubes. Also known as tube adapters and weldable threaded tube ends, they weld easily to both mild steel and alloy steel but cannot be welded to coated metal. Nuts are made from 4130 alloy steel. They have a Class 2B thread fit and are not rated for hardness.

To Order: Please specify right-hand or left-hand threads.

General Purpose Washers—USS and SAE (Type A)

USS Standard

SAE Standard

USS and SAE (Type A) are the most widely used types of washers. SAE standard washers generally have a smaller ID and OD than USS standard washers. Commonly used with bolts, screws, and nuts, all (except washers made from Type 316 stainless steel) meet ASME B18.22.1. 18-8 stainless steel washers have a minimum Rockwell hardness of B75; all others are not rated for hardness.

Type 316 stainless steel and ***18-8 stainless steel*** washers have excellent corrosion resistance and may be mildly magnetic. ***Black-luster-coated steel*** washers have a durable finish that while decorative, also provides 500 hours of salt spray resistance per ASTM B117 and corrosion resistance superior to zinc-plated and black-oxide finishes. ***Hot-dipped galvanized steel*** and ***zinc-plated steel*** washers have good rust resistance. ***Black-oxide steel*** washers have mild rust resistance.

Package quantities for zinc-plated and plain steel washers are approximate, except for packages of 100.

General Purpose Washers—USS and SAE (Type A) (Continued from previous page)

USS Standard

SAE Standard

USS and SAE (Type A) are the most widely used types of washers. SAE standard washers generally have a smaller ID and OD than USS standard washers. Commonly used with bolts, screws, and nuts, all (except washers made from Type 316 stainless steel) meet ASME B18.22.1. 18-8 stainless steel washers have a minimum Rockwell hardness of B75; all others are not rated for hardness.

Type 316 stainless steel and ***18-8 stainless steel*** washers have excellent corrosion resistance and may be mildly magnetic. ***Black-luster-coated steel*** washers have a durable finish that while decorative, also provides 500 hours of salt spray resistance per ASTM B117 and corrosion resistance superior to zinc-plated and black-oxide finishes. ***Hot-dipped galvanized steel*** and ***zinc-plated steel*** washers have good rust resistance. ***Black-oxide steel*** washers have mild rust resistance.

Package quantities for zinc-plated and plain steel washers are approximate, except for packages of 100.

Screw Size	ID	OD	Thick., Min.-Max.	Pkg. Qty.		Per Pkg.

General Purpose Stainless Steel Washers

Why pay for precision you don't need? These washers are not made to USS or SAE standards, so they're economical alternatives when tight tolerances are not important. Made from stainless steel for excellent corrosion resistance, they may be mildly magnetic and are not rated for hardness.

Highly Polished Chrome-Plated Washers

Polished for an attractive, finished appearance, these chrome-plated steel Type A washers are wear and corrosion resistant. All meet SAE standards, except 93960A120, which meets USS standards. Dimensions meet ASME B18.22.1. Not rated for hardness.

High-Strength Grade 8 Steel Washers—USS and SAE (Type A)

Suited for use in Grade 5 and Grade 8 fastening applications, these washers are made from C1035-C1050 steel. They're through-hardened to a minimum Rockwell hardness of C38 and have dimensions that meet ASME B18.22.1.

Zinc yellow-chromate plated steel washers have good rust resistance.

Ultra-coated steel washers are treated with a silver water-based inorganic coating that provides better corrosion resistance than zinc yellow-chromate steel. They meet ASTM F436 (Type 3).

Structural Washers for ASTM A325 Bolts

Use these ASTM F436 (Type 1) structural washers with A325 bolts, studs, and nuts for construction and exterior building applications. They're made from C1035-C1050 steel and have a minimum Rockwell hardness of C38. Thickness range is 0.09″ to 0.18″. ***Plain steel*** washers are free of coatings and finishes. ***Hot-dipped galvanized steel*** washers are coated for excellent resistance to rust, weather, and corrosion.

Extreme-Strength Grade 9 Steel Washers

Designed expressly for use with our popular Grade 9 hex head cap screws and nuts, these very high strength washers are also known as L9 washers. Each is made from zinc yellow-chromate plated Grade 9 steel (C1050) and has a minimum Rockwell hardness of C43.

Tension-Indicating Structural Washers for ASTM A325 Bolts

A quick glance is all it takes to check that your joints are secure. These unique washers emit an orange dye once they've been installed correctly. Use with Grade 2H or DH nuts and ASTM A325 bolts. Washers meet ASTM F959. Dimensions meet ASME B18.2.6. They're made from C1045 steel and are not rated for hardness.

Military Specification Washers

Made to stringent specifications, these washers conform to criteria defined by MS (Military Standard), NAS (National Aerospace Standard), AN (Air Force/Navy Aeronautical Standard), and NASM (National Aerospace Standard Military). Material and dimensions meet FF-W-92, unless noted. Washers are not rated for hardness.

Cadmium-plated steel washers are made from C1005-C1025 steel. They have a cadmium plating that adds excellent rust and weather resistance. All meet QQ-P-416 (Type 2, Class 2) except MS 27183 washers, which meet QQ-P-416 (Type 2, Class 3).

300 series stainless steel washers are passivated (treated with nitric acid for protection against oxidation and corrosion). They may be mildly magnetic.

● Do not meet FF-W-92.

High-Strength Corrosion-Resistant Washers

Each of the washer materials below has a unique combination of features including high strength and corrosion resistance.

A286 Super Alloy— A nonmagnetic iron-based material containing 26% nickel and 15% chromium, it has the strength of alloy steel plus corrosion resistance similar to 18-8 stainless steel. All washers are Type A. They meet ASME B18.22.1 and have a minimum Rockwell hardness of C22. Sizes No. 2 thru No. 10 meet SAE standards; sizes 1/4″ and larger meet USS standards.

Hastelloy— Resists corrosive chemicals and is nonmagnetic. All washers are Type A. They meet ASME B18.22.1 and USS standards and are not rated for hardness.

17-7 PH Stainless Steel— Combines the high strength of hardened alloy steel with corrosion resistance that's similar to 18-8 stainless steel. Washers may be mildly magnetic and have a minimum Rockwell hardness of C40.

Alloy 20 Stainless Steel— Also known as Carpenter 20, this stainless steel alloy is especially resistant to pitting and corrosion from sulfuric and other acids. Washers may be mildly magnetic and are not rated for hardness.

Nickel-Copper Alloy 400— Also known as Monel, this material has exceptional resistance to temperature extremes and corrosion in salty or brackish water, so it's well suited for marine applications. Washers may be mildly magnetic and have a minimum Rockwell hardness of C45.

Titanium (Grade 2)— Offers outstanding corrosion resistance—even better than 18-8 or Type 316 stainless steel. As strong as steel with only 57% of the weight, it's nonmagnetic and has excellent temperature resistance. Washers have a minimum Rockwell hardness of B80, unless noted.

★ Not rated for hardness.

Lightweight Aluminum Washers

As strong as mild steel with just one-third the weight, aluminum washers resist weather-related corrosion and are nonmagnetic. They have a minimum Rockwell hardness of B67.

Alloy 1100-H14 offers excellent corrosion resistance and workability. It's good for use in low-strength applications.

Alloy 2024-T3/T4 has slightly lower strength than soft steel and lower corrosion resistance than Alloy 6061-T6. It's commonly used as an aircraft alloy.

Alloy 6061-T6 has good corrosion resistance and is stronger than Alloy 1100-H14.

Military Specification Aluminum Washers

Chemically treated with an electrically conductive gold-colored film, these Alloy 2024-T3 washers meet the stringent military standards established in NAS (National Aerospace Standard) 1149. All (except 94589A300 and A420) can be used as substitutes for AN 960 washers. Washers are nonmagnetic and not rated for hardness.

Large-Diameter Plain Steel Washers

Ideal to distribute wide loads. Washers are made from case-hardened C1008-C1018 steel and have a black-oxide finish. They have a minimum surface hardness of Rockwell C40.

Large-Diameter Washers

An extra-large bearing surface makes these washers great for covering oversized holes. Also known as fender washers, they're not rated for hardness.

Type 316 stainless steel offers corrosion resistance that's superior to 18-8 stainless steel. It may be mildly magnetic.

18-8 stainless steel has excellent corrosion resistance and may be mildly magnetic.

Zinc-plated steel has good rust resistance.

Washers for Soft Materials (Type B)

Wider than Type A washers, these washers disperse holding force over a large area, which limits damage to soft materials. All meet ASME B18.22.1.

18-8 stainless steel washers provide excellent corrosion resistance. They may be mildly magnetic and are not rated for hardness.

Zinc-plated steel washers are rust resistant and have a minimum Rockwell hardness of B40.

Thick Washers

Also known as finished, setup, and fixture washers, these precision washers are often used in die-and-jig fixture setups.

18-8 stainless steel washers offer excellent corrosion resistance. They may be mildly magnetic and have a minimum Rockwell hardness of B70. ***Brass*** washers are corrosion resistant, electrically conductive, nonmagnetic, and not rated for hardness. ***Black-oxide case-hardened steel*** washers are made from C1008, C1010, or 12L14 steel and have a minimum surface hardness of Rockwell C40.

Also Available: 17-4 PH stainless steel washers (with better corrosion resistance than 18-8 stainless steel washers) in sizes marked with a bullet. Please ask for 98049A200 and specify screw size.

Extra-Thick High-Strength Steel Washers

Perfect for use with Grade 8 steel screws and socket head cap screws, these alloy steel washers are also useful as spacers and levelers on uneven surfaces. They're heat treated and marked with the bolt size for easy identification. Made from C1048 or C1050 steel, each has a zinc yellow-chromate finish and a minimum Rockwell hardness of C43.

Extra-Thick Steel Washers

Use these extra-thick, beveled-edge washers in spacing applications and as tooling and fixturing components.

Hot-dipped galvanized steel washers are made from C1008 steel. They have a larger OD and are more corrosion resistant than plain steel washers. Minimum Rockwell hardness is B40.

Plain steel washers are made from 12L14 steel. Free of coatings and finishes, they have a minimum Rockwell hardness of B80.

Jumbo Washers

Extra wide and thick, these washers have a large bearing surface that enables wide load distribution.

18-8 stainless steel washers provide excellent corrosion resistance. They may be mildly magnetic and have a minimum Rockwell hardness of B70.

Steel sizes through 1¼″ are zinc plated; larger sizes have a black-oxide finish. All have a min. Rockwell hardness of B40.

General Purpose Nylon Washers

An economical choice, these multi-tasking nylon washers provide electrical insulation, reduce friction, and can minimize wear between parts. They are not rated for hardness. *Note:* Nylon absorbs moisture which can affect dimensions and other properties.

Nylon 6/6 washers are reliable up to 180° F. **To Order:** Please specify black or off-white.

Glass-filled nylon washers are reliable up to 230° F and stronger than nylon 6/6 washers. Color is off-white.

Low-Friction PTFE Washers

With the lowest friction of all thermoplastics and excellent dimensional stability, these washers are well suited for use between moving parts. They're reliable up to 500° F. Color is white. Not rated for hardness.

Low-Friction and Wear-Resistant UHMW Polyethylene Washers

Ultra-high molecular weight washers are more wear resistant than PTFE washers, but have similar low-friction and chemical-resistance properties. They're reliable up to 180° F. Color is off-white. Not rated for hardness.

Also Available: Chemical resistant polypropylene washers in sizes marked with a ★. Reliable up to 212° F. Please ask for 98594A990 and specify screw size.

Low-Friction High-Strength PEEK Washers

Washers made from this slick material are stronger than those made from PTFE. They're nonconductive, extremely stable in hostile environments, and withstand water and steam without loss of physical properties. All are reliable up to 500° F. Color is tan. Not rated for hardness.

Wear- and Chemical-Resistant Nylatron Washers

Our long-lasting Nylatron washers are nonabrasive and impregnated with lubricant for low friction. Chemical resistance makes them good alternatives to corrosion-susceptible metal washers. All are reliable up to 220° F. Color is dark gray. Not rated for hardness.

Insulating Hard Fiber Washers

Made of plant-based fiber, these washers protect surfaces from scratches and withstand compression better than washers made from soft fibers such as felt. Use them as insulating washers, light duty sealing washers, and dielectric barriers. All are reliable at temperatures up to 230° F. Not rated for hardness.

Note: Fiber absorbs moisture, which can affect dimensions and other properties.

Gray or Red—Thickness tolerance is ±0.005″.

Insulating Fiberglass Washers

Fiberglass provides good electrical and thermal insulation and gives these washers a high strength-to-weight ratio. They're resistant to chemicals and reliable up to 212° F. Color varies from light tan to light green. Not rated for hardness.

High-Temperature Polyimide Washers

Reliable up to 464° F and nonconductive—these washers are excellent electrical insulators. They won't chip or flake under loads. Color varies from red-brown to yellow-orange. Not rated for hardness.

General Purpose Metric Washers—DIN 125

Offered in standard metric sizes, these washers have dimensions that meet DIN 125 (unless noted).

Type 316 stainless steel washers are more corrosion resistant than 18-8 stainless steel washers and may be mildly magnetic. Not rated for hardness.

18-8 stainless steel washers offer excellent corrosion resistance and may be mildly magnetic. Not rated for hardness.

Brass washers are corrosion resistant, nonmagnetic, electrically conductive, and softer than washers made from stainless steel and Class 4 steel. Not rated for hardness.

Zinc-plated Class 4 steel washers offer good rust resistance and have a minimum Rockwell hardness of B74.

Also Available: Black-oxide 18-8 stainless steel washers in sizes marked with a ♥. Please ask for 98269A410 and specify screw size.

Metric Acid-Resistant Bumax 88 Stainless Steel Washers

Made from a special stainless steel that's equal in strength to Class 8 steel and highly resistant to acids. Washers meet DIN 9021/ISO 7093, unless noted. They may be mildly magnetic and have a minimum Rockwell hardness of B90.

Screw Size	ID, mm	OD, mm	Thick., Min.-Max., mm	Pkg. Qty.		Per Pkg.

▲ Meets ISO 7089.

Metric Large-Diameter Washers—DIN 9021

Cover oversized holes with these extra-wide washers.

Type 316 stainless steel washers are more corrosion resistant than 18-8 stainless steel washers and may be mildly magnetic. Not rated for hardness.

18-8 stainless steel washers offer excellent corrosion resistance and may be mildly magnetic. They have a minimum Rockwell hardness of B52.

Zinc-plated steel washers offer good rust resistance and have a minimum Rockwell hardness of B56.

■ Plain steel.

Metric Extra-Thick Washers

Also known as finish, setup, and fixture washers, these hefty washers are frequently used in die-and-jig setups.

18-8 stainless steel washers offer excellent corrosion resistance and may be mildly magnetic. They have a minimum Rockwell hardness of B70.

Black-oxide case-hardened steel washers are mildly rust resistant. They are not rated for hardness.

Metric Insulating Hard-Fiber Washers

Made from plant-based fiber, these washers withstand compression better than washers made from leather and soft fibers such as felt, yet they won't mar surfaces. Useful as insulating washers and light duty sealing washers, they're reliable up to 230° F. Color is black. *Note:* Washers absorb moisture which can affect dimensions and other properties.

Blind Rivet Washers

Use with rivets for extra support when fastening soft materials. Also known as backup plates, washers are 0.05″-0.07″ thick. Not rated for hardness.

18-8 stainless steel washers offer excellent corrosion resistance and may be mildly magnetic.

Aluminum washers are corrosion resistant and nonmagnetic.

Zinc-plated steel washers are made from C1006-C1015 steel. They offer good rust resistance.

Self-Aligning Washer Sets

Male Half

Female Half

Also known as spherical washers and self-aligning setup washers, these two-piece washer sets swivel to compensate for uneven surfaces. They're frequently used in clamping and die-and-jig fixturing applications.

18-8 stainless steel washers offer excellent corrosion resistance and may be mildly magnetic. Inch sizes have a minimum Rockwell hardness of B80; metric sizes are not rated for hardness.

Black-oxide and ***black case-hardened steel*** washers are mildly rust resistant. Inch sizes are made from 12L14 steel and have a minimum surface hardness of Rockwell C48. Metric sizes are not rated for hardness.

Also Available: Individual male and female halves. Please specify screw size. For 18-8 stainless steel inch sizes, please ask for 91944A555 for male halves and 91944A777 for female halves. For black-oxide steel inch sizes, please ask for 91131A555 for male halves and 91131A777 for female halves. For 18-8 stainless steel metric sizes, please ask for 94007A444 for male halves and 94007A888 for female halves. For black case-hardened steel metric sizes, please ask for 98148A555 for male halves and 98148A777 for female halves.

Square Washers

Square washers are wider and thicker than standard washers, so they distribute heavy loads more efficiently.

Small washers are made from rust-resistant zinc-plated C1008-C1020 steel.

Medium, ***large***, and ***jumbo*** washers provide wide load distribution. Each is 1/4″ (±0.03″) thick.

18-8 stainless steel washers offer excellent corrosion resistance and may be mildly magnetic. They have a min. Rockwell hardness of B70.

Galvanized steel washers are weather resistant and made from C1006-C1015 steel. They have a minimum Rockwell hardness of B40.

Black-oxide case-hardened steel washers are mildly rust resistant and have a minimum surface hardness of Rockwell C40.

Anti-Rotating Clipped Washers

Cropped to fit where standard washers can't, these D-shaped washers won't rotate when you position the clipped edge against a flat surface. Made from C1008-C1010 steel, they offer mild rust resistance and have a minimum surface hardness of Rockwell B90.

Notched Washers for Wood

Temporarily secure these malleable iron washers by driving nails in the notches. Also called No. 10 Western Timber, and Victor washers, they meet ASTM A47 and have a minimum Rockwell hardness of B62.

Easy-Install Slotted Washers

You can install and remove these washers without removing the nut or bolt first. Made from black-oxide case-hardened steel, they offer mild rust resistance and have a minimum surface hardness of Rockwell C40.

Split Lock Washers

Compared to regular flat washers, split lock (or spring lock) washers reduce the likelihood that your fastened joint will loosen under shock or vibration. Under compression, spring tension forces the split ends to dig into mating surfaces and hold tight. Washer dimensions meet ASME B18.21.1 (unless noted).

Type 316 stainless steel provides better corrosion resistance than 18-8 stainless steel. ***18-8 stainless steel*** offers excellent corrosion resistance. Both materials may be mildly magnetic and have a minimum Rockwell hardness of C35.

Aluminum is ideal for outdoor use. It's nonmagnetic and has a minimum Rockwell hardness of B87.

Nickel-copper Alloy K500 (also known as Monel) resists heat and corrosion. It's slightly magnetic and not rated for hardness.

Silicon bronze is mildly corrosion resistant, nonmagnetic, and has a minimum Rockwell hardness of B90.

Hot-dipped galvanized steel provides excellent protection against rust, weather, and corrosion. ***Zinc-plated steel*** provides good rust resistance. ***Plain steel*** is made from high-strength steel. Each has a minimum Rockwell hardness of C38.

Heavy Duty Split Lock Washers

Choose these split lock washers when your application calls for extra strength. Washers meet ASME B18.21.1.

18-8 stainless steel offers excellent corrosion resistance. Washers may be mildly magnetic and have a minimum Rockwell hardness of C35.

Zinc yellow-chromate plated alloy steel and ***steel*** washers have a minimum Rockwell hardness of C38. They're used with Grade 5 and Grade 8 fasteners. Alloy steel are made from through-hardened Alloy 4037 steel. Steel are made from rust-resistant C1060 steel.

Military Specification Stainless Steel Split Lock Washers

Made from 300 series stainless steel, these washers meet the stringent military standards FF-W-84 and MS 35338, plus they're passivated (treated with nitric acid for protection against oxidation and corrosion) to QQ-P-35. Each has a minimum Rockwell hardness of C35 and may be mildly magnetic.

Metric Split Lock Washers—*DIN 127B*

Sized to work with metric screws and nuts, these washers use spring tension to resist loosening from shock and vibration. Stainless steel washers are not rated for hardness. Spring steel washers have a minimum Rockwell hardness of C44.

Type 316 stainless steel washers offer superior corrosion resistance and may be mildly magnetic. ***18-8 stainless steel*** washers offer very good corrosion resistance and may be mildly magnetic. ***Zinc-plated spring steel*** washers offer good rust resistance. ***Black-finish spring steel*** washers offer mild rust resistance.

Also Available: High-visibility blue split lock washers that meet ASME B18.21.2M in screw sizes marked with a ★. Please ask for 93279A220 and specify screw size.

Split Lock Washers for Socket Head Cap Screws

Also called high-collar lock washers, these washers have smaller ODs for use with socket head cap screws.

18-8 stainless steel washers offer excellent corrosion resistance and may be mildly magnetic. Inch sizes have a minimum Rockwell hardness of C35; metric are not rated for hardness. ***Plain steel*** washers are made from C1055-C1065 steel. As a result of heat treatment, they have a dark surface and resist rust. Minimum Rockwell hardness is C38. ***Black-finish spring steel*** washers have a black finish that adds rust resistance. Minimum Rockwell hardness is C44.

Inch Sizes— *Washer dimensions meet ASME B18.21.1*

External-Tooth Lock Washers

For maximum holding power, these washers have multiple teeth that dig into mating surfaces to resist vibration and loosening. They're perfect for use with binding head, pan head, and round head screws, which have heads large enough to make contact with the teeth. Washer dimensions meet ASME B18.21.1 (unless noted).

18-8 stainless steel washers provide excellent corrosion resistance, may be mildly magnetic, and are not rated for hardness. ***400 series stainless steel*** washers are stronger and more magnetic than 18-8 stainless steel. They're also corrosion resistant and have a minimum Rockwell hardness of C34. ***Zinc-plated steel*** washers are made from C1050 steel and are rust resistant. They have a minimum Rockwell hardness of C40. ***Phosphor bronze*** washers are corrosion resistant, nonmagnetic, and have a minimum Rockwell hardness of B60.

Also Available: Type 316 stainless steel external-tooth lock washers in sizes marked with a ●. Please ask for 90375A880 and specify screw size.

★ Does not meet ASME B18.21.1.

Countersunk External-Tooth Lock Washers

Washer teeth lock onto the heads of 82° flat and oval head countersunk screws to resist loosening. Dimensions meet ASME B18.21.1.

400 series stainless steel washers are corrosion resistant, magnetic, and have a minimum Rockwell hardness of C34. ***Zinc-plated steel*** washers are made from C1050 steel. They offer good rust resistance and have a minimum Rockwell hardness of C44.

Metric External-Tooth Lock Washers

With external teeth that dig into mating surfaces, these washers are a good choice for metric parts that require vibration resistance.

External—Use with screws that have large enough heads to make contact with the washer teeth (such as round, pan, and binding head). Dimensions meet DIN 6797.

Serrated—Angled teeth absorb shock and vibration to maintain fastening tension. Dimensions meet DIN 6798.

18-8 stainless steel washers offer excellent corrosion resistance. They may be mildly magnetic and have a minimum Rockwell hardness of B85.

Zinc-plated spring steel washers offer good rust resistance. They have a minimum Rockwell hardness of C35.

Internal-Tooth Lock Washers

Internal teeth dig in to resist loosening and the smooth outside edge won't snag nearby objects. Dimensions meet B18.21.1 (unless noted).

18-8 stainless steel washers provide excellent corrosion resistance. They may be mildly magnetic and are not rated for hardness.

400 series stainless steel washers are corrosion resistant and magnetic. Minimum Rockwell hardness is C34.

Zinc-plated steel washers are made from C1050-C1065 steel and are rust resistant. Minimum Rockwell hardness is C44.

Phosphor bronze washers are corrosion resistant and nonmagnetic. Minimum Rockwell hardness is B60.

Also Available: Type 316 stainless steel internal-tooth lock washers in sizes marked with a ●. Please ask for 91108A900 and specify screw size.

Military Specification Internal-Tooth Lock Washers

Designed to rigorous military specifications, these lock washers meet MS (Military Standard) and NASM (National Aerospace Standard Military) 35333. Passivated (treated with nitric acid for protection against oxidation and corrosion) to meet QQ-P-35, they have internal teeth that dig into surfaces to prevent loosening. Made from Type 410 stainless steel. Magnetic. Not rated for hardness.

Also Available: Type 410 stainless steel external-tooth lock washers that meet MS 35335. Please ask for 97775A100 and specify screw size.

Heavy Duty Internal-Tooth Lock Washers

Count on these washers to retain locking tension under heavy loads. Often used with heavy bolts and nuts on castings and heavy machinery, they have strong internal teeth that dig into surfaces to resist loosening. Washers meet ASME B18.21.1 and are made from C1050 steel. They're zinc plated for rust resistance and have a minimum Rockwell hardness of C44.

Metric Internal-Tooth Lock Washers

Just like our popular inch size internal-tooth lock washers, these have internal teeth that dig into surfaces to resist loosening. The external edge is smooth and snag-free. Dimensions meet DIN 6797.

18-8 stainless steel washers provide excellent corrosion resistance. They may be mildly magnetic and have a minimum Rockwell hardness of B85.

Black-finish spring steel washers are mildly rust resistant and have a minimum Rockwell hardness of C35.

Internal/External-Tooth Lock Washers

Made from C1050 steel. Zinc plated for rust resistance.

Washers ***for extra grip*** have multiple teeth for more holding power. Ideal for electrical connections, they meet ASME B18.21.1 (unless noted). Minimum Rockwell hardness is C40.

Washers ***for soft materials*** are slightly domed and have a large overall diameter that distributes loads over a wide area. They're also great for covering oversized holes. Minimum Rockwell hardness is C44.

Wedge Lock Washers

Also called NORD-LOCK® washers, these reusable washers hold tight under extreme vibration. They include a pair of washers (one top and one bottom) with wedges that lock against each other to resist loosening. Washers have an ID and OD tolerance of ±0.012" and an assembly thickness tolerance of –0.02" to +0.01".

Type 316 stainless steel washers offer excellent corrosion resistance and may be mildly magnetic. They have a minimum Rockwell hardness of C51.

Zinc-coated steel washers are suitable for use with Grade 8 and Class 10.9 metric bolts. They're made from through-hardened steel and have a coating of zinc for resistance to both rust and 600 hours of salt-spray. Minimum Rockwell hardness is C44.

Corrosion-Resistant Acetal Spring Washers

The lubricity of these white acetal washers provides corrosion resistance and allows them to be used underwater and in rotating assemblies. Washers are also electrically and thermally insulating. Not rated for hardness. Temperature range is –40° to +200° F. Package quantity is 100 (unless noted).

Belleville Spring Lock Washers

Serrated

Also known as conical washers, these washers have a slightly cupped shape that gives them spring-like flexibility to resist loosening due to heat and vibration. ***Serrated*** washers have small grooves for extra grip against surfaces. For Belleville disc springs, see pages 1229-1232.

18-8 stainless steel washers offer excellent corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B85.

Steel washers with a *black finish* are mildly rust resistant; those with a *zinc plating* offer good rust resistance. All steel washers are made from C1060-C1075 steel and have a minimum Rockwell hardness of C40.

Type 301 stainless steel washers offer good corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B85.

Note: Overall height listed is the minimum uncompressed height.

Serrated on Top and Bottom—For Socket Head Cap Screws

Wave Washers

Single-Wave Washer

Triple-Wave Washer

Use these curved, flexible washers to compensate for tolerance variations, cushion light loads, and dampen rattling connections. ***18-8 stainless steel*** washers provide excellent corrosion resistance. They may be mildly magnetic and have a minimum Rockwell hardness of B78. ***Spring steel*** washers are made from C1050-C1075 steel and are not rated for hardness. ***Steel*** washers are made from C1050-C1065 steel and have a minimum Rockwell hardness of C44.

Countersunk Washers

Give flat and oval head countersunk-head screws a neat, finished appearance. Washers are not rated for hardness, except 18-8 stainless steel metric washers which have a minimum Rockwell hardness of B78.

Type 316 stainless steel washers are the most corrosion resistant. They may be mildly magnetic.

18-8 stainless steel washers provide excellent corrosion resistance and may be mildly magnetic.

Brass washers are rust resistant, electrically conductive, and nonmagnetic. ***Black zinc-plated brass*** washers have an attractive black surface. ***Nickel-plated brass*** washers have a decorative silver surface.

Nickel-plated steel washers are made from C1006-C1010 steel. They have a decorative silver surface and are fairly resistant to rust and weather.

Zinc-plated steel washers are made from C1006-C1010 steel. They offer good rust resistance.

Also Available: Nickel-plated brass washers in sizes marked with a ♥. Please ask for 92922A100 and specify screw size.

Nylon Countersunk Washers

Use these nylon 6/6 washers with standard 82° flat and oval head countersunk-head screws to insulate, cushion, and add space between parts. They won't scratch smooth surfaces and are reliable from –40° to +185° F.

Countersunk Washers for Socket Head Screws

Also known as dress washers, these washers add a finished appearance to flat head socket head cap screws (or any other flat head screw). Inch sizes accept 82° screws and have an OD and thickness tolerance of ±0.010″. Metric sizes accept 90° screws and have an OD and thickness tolerance of ±0.3 mm.

18-8 stainless steel washers offer excellent corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B60. ***Black-oxide hardened steel*** washers are made from hardened 12L14 steel. The black-oxide finish adds mild rust resistance. Minimum surface hardness is Rockwell C40.

Nylon Sleeve Washers

Plain

Flanged

Use these nylon 6/6 washers as a barrier around fasteners to prevent corrosive reactions between different metals, block electric current, and reduce vibration. They're resistant to hot oils, saltwater, and alkalies, as well as many other chemicals. Reliable from –40° to +185° F, color is off-white.

Flanged washers have a minimum Rockwell hardness of R118 (plain washers are not rated for hardness).

Note: Nylon absorbs moisture which can affect dimensions and other properties.

Cup Washers for Oversized Holes

Cover oversized holes such as the end of a pipe or tube with these bowl-shaped, flanged washers. You can even press them into soft surfaces to create a flush recess for screw and bolt heads. Made from zinc-plated C1008-C1010 steel, they have a minimum Rockwell hardness of B40 and an overall height of 0.197″.

Large OD Washers for Foam Insulation and Plaster

Tab

Flat

Repair foam insulation and sagging, cracked plaster with these washers. Use with self-sinking flat head (bugle head) screws. Made from corrosion-resistant galvanized steel, they have a minimum Rockwell hardness of B35.

Tab washers have four 5/16″ long prongs that pierce insulation so they stay in place and won't spin. ***Flat*** washers have four 0.23″ dia. holes that allow plaster to flow through to form a secure bond between washer and wall.

Washers for Ball Joint Rod Ends

Also known as retaining safety washers, these beveled washers allow a full range of ball joint movement while reducing the chance of rod end failure. They're made from zinc-plated C1018 steel and are not rated for hardness.

Nylon Self-Retaining Washers

When you slip this washer onto a screw shank, the specially shaped center grips it tightly. Washers are made from off-white nylon 6/6. They're reliable from –40° to +185° F and are not rated for hardness. *Note:* Nylon absorbs moisture, which can affect dimensions and other properties.

Vented 18-8 Stainless Steel Washers

Tiny channels allow fluids and gases to escape. Suitable for use in Class 100 clean room environments, they're made from 18-8 stainless steel and may be mildly magnetic. Not rated for hardness.

Washers for Square-Neck Bolts

Use these pronged washers with square-neck bolts (such as carriage bolts) to dig into ductile materials and prevent rotation. Washers are made from rust-resistant zinc-plated C1006 steel and have a minimum Rockwell hardness of B47.

Screw Size	Square ID	OD	Thick., Min.-Max.	Pkg. Qty.		Per Pkg.

Pressure-Sealing Washers

Create a reliable seal against oil, water, fuels, and gases. These reusable washers consist of a molded Buna-N (nitrile) rubber seal in a steel washer. When compressed, they form a seal around the fastener shank that's reliable at temperatures from -30° to +225° F.

Thickness given includes steel portion only.

For Nuts and Washers— Also known as thread-sealing washers. Use under nuts and washers.

For Screws and Bolts— Also known as stat-o-seal washers. Use under fastener heads.

Inch sizes are made from zinc-plated steel, which has a minimum Rockwell hardness of B71. Seals have a minimum durometer hardness of 55A.

Metric sizes are made from zinc-plated chrome-moly Alloy 4130 steel, which is not rated for hardness. Seals have a minimum durometer hardness of 85A.

Very High-Pressure Metal-Bonded Sealing Washers

Lock out up to 8,500 psi of liquid pressure with these high-strength, one-piece washers. They're made from Type 316 stainless steel bonded to a special black plastic sealant. When tightened, the sealant flows under the washer and around fastener threads to create an impervious 360° seal. Frequently used in compressor, electronic, filter, lighting, and marine applications, they have a minimum Rockwell hardness of B75 and are reliable from –60° to +275° F.

Metal-Bonded Sealing Washers

Cushion bolt heads and seal leaky joints with these resilient, one-piece rubber-to-metal bonded washers.

The *18-8 stainless steel backing* has a minimum Rockwell hardness of B80. It offers excellent corrosion resistance and may be mildly magnetic. The *galvanized steel backing* has a minimum Rockwell hardness of B50. It's made from 20-gauge steel, which offers good corrosion resistance. The *aluminum backing* has a minimum Rockwell hardness of B64. It's made from alloy 5052, which is ideal for outdoor use.

Neoprene Bonded— Washers are 1/8″ thick. They are not rated for pressure. The neoprene portion is black with a temperature range of –45° to +250° F and a durometer hardness of 65A-75A.

Silicone Bonded— Washers are 5/32″ thick and have a maximum pressure rating of 100 psi for fluids and gases. The silicone portion is green with a temperature range of –160° to +500° F and a durometer hardness of 65A-75A.

Rubber Washers

Choose these weather resistant, black rubber washers for superior cushioning, sealing, and vibration damping.

Neoprene— These abrasion resistant all-purpose washers are resistant to flame, oil, and contact with many chemicals. They have a durometer hardness of 55A-65A and a temperature range of –30° to +220° F. Thickness tolerance is ±0.015″.

EPDM— Perfect for outdoor use, these washers are resistant to ozone, steam, and water. They have a durometer hardness of 55A-65A and a temperature range of –20° to +212° F. Thickness tolerance is ±0.02″.

Polyurethane Washers

These rubberlike washers dampen vibration and remain flexible at low temperatures. They're perfect for light duty sealing and are resistant to moisture and chemicals. Durometer hardness is 40A-75A. Temperature range is –10° to +150° F. Color is orange.

Sealing Washers

Great for sealing, but also excellent for shock absorption, vibration control, cushioning, and insulating.

Aramid/Buna-N—Made from strong aramid fibers with a Buna-N binder, these washers resist mild acids, most alkalies, salt, water, steam, grease, oil, and detergents. Materials meet ASTM F104. Temp. range is –20° to +460° F. Durometer hardness is 70A. Color is green.

Expanded PTFE—Softer and more flexible than standard PTFE, these washers conform easily to irregular surfaces and will not discolor. Resistant to salts, water, steam, grease, oil, detergents, alkalies (excluding molten alkali metals and elemental fluorine), and acids. Temperature range is –200° to +400° F. Not rated for hardness. Color is white.

Cork Rubber—Washers made from this blend of cork granules and neoprene are highly compressible with excellent cushioning and vibration damping properties. Oil and fuel resistant, the material also meets ASTM P2256A. Temperature range is –10° to +120° F. Durometer hardness is 65A. Color is tan.

Viton® Fluoroelastomer—This fluorocarbon elastomer is one of the best materials available for fuel, oil, and chemical resistance. It meets ASTM D2000. Temperature range is –13° to +500° F. Durometer hardness is 75A. Color is black.

Fluorosilicone—Better than silicone rubber in corrosive conditions, these rubber washers also resist fuel, solvents, and ozone. Material meets ASTM D2000. Temperature range is –65° to +400° F. Durometer hardness is 60A. Color is blue.

Silicone—FDA compliant and ideal for a wide range of temperatures. Material meets ASTM D2000 and ZZR-765. Temperature range is –100° to +450° F. Durometer hardness is 60A. Color is red.

Santoprene—This advanced elastomer provides excellent ozone and weather resistance, plus good chemical resistance. Temperature range is –40° to +275° F. Durometer hardness is 64A. Color is black.

♣ OD is 7/16″.

Vibration-Damping Rubber Washers

A deeply indented grid pattern gives these vibration-damping washers the unique ability to prevent sideways shifting. They're reliable to 150° F. Color is black.

Buna-N (Nitrile)—Offer great oil and fuel resistance, but are not as weather resistant as neoprene washers. Durometer hardness is 20A-30A.

Neoprene—These weather resistant, all-purpose washers also resist abrasion, flame, oil, and contact with many chemicals. Durometer hardness is 65A-75A.

Felt Washers

They're ideal for insulating, cushioning, sealing, and vibration damping, but you can also soak these all-wool, gray felt washers with oil and use them for lubrication. They meet ASTM D2475 and SAE F-3. Temperature range is –80° to +200° F. Not rated for hardness.

Stainless Steel Shims

Accurately align, level, and adjust spacing on all types of shafts and machinery. Shims have an ID tolerance of +0.011″ and an OD tolerance of ±0.002″. They have a minimum Rockwell hardness of B70, meet ASTM A240, and may be mildly magnetic.

Type 316 stainless steel shims are more corrosion resistant than 18-8 stainless steel shims. ***18-8 stainless steel*** shims offer excellent corrosion resistance.

Type 316 Stainless Steel

Steel Shims

Use for fast, accurate spacing on all types of shafts and machinery. Shims have an ID tolerance of +0.011″ and an OD tolerance of ±0.002″.

Plain steel shims are made from C1008-C1010 steel. They have a minimum Rockwell hardness of B65. ***Spring steel*** shims are harder and hold their shape better than plain steel shims. They have a minimum Rockwell hardness of C44.

***Thin Assortment*—**Includes 10 each of five sizes in 0.005″, 0.010″, and 0.015″ thicknesses. Sizes (ID×OD): 3/8″×5/8″, 1/2″×3/4″, 5/8″×1″, 3/4″×1 1/8″, and 7/8″×1 3/8″. Furnished in a compartmented plastic box.

98085A210 ..... **Each** $66.08

***Thick Assortment*—**Includes 10 each of five sizes in 0.020″, 0.031″, and 0.125″ thicknesses. Sizes (ID×OD): 3/8″×5/8″, 1/2″×3/4″, 5/8″×1″, 3/4″×1 1/8″, and 1″×1 1/2″. Furnished in a compartmented plastic box.

98085A310 ..... **Each** $93.24

Aluminum, Brass, and Copper Shims

Accurately align, level, and adjust spacing on all types of shafts and machinery. Shims have an ID tolerance of +0.011″ and an OD tolerance of ±0.002″. All are nonmagnetic.

Aluminum shims are made from Alloy 5052. They offer mild resistance to weather-related corrosion and have a minimum Rockwell hardness of B72.

Brass shims provide good strength and corrosion resistance. They meet ASTM B36, except 0.125″ thick shims, which meet ASTM B36 or B16. Minimum Rockwell hardness is B60.

Copper shims are corrosion resistant and provide excellent electrical conductivity. They meet ASTM B152 and are not rated for hardness.

Slotted Round Shims

Slip them on, pull them off—no disassembly required. Shims are not rated for hardness.

18-8 stainless steel shims provide excellent corrosion resistance and may be mildly magnetic. ***Zinc-plated steel*** shims are made from C1006-C1015 and are zinc-plated for good rust resistance.

Color-Coded Plastic Shims

Identify thickness by color. Nonconductive; oil resistant. ID tolerance is +0.015″; OD tolerance is ±0.005″; thickness tolerance is ±5%.

To Order: Please specify thickness from the chart below.

13-piece shim assortments include one of every thickness listed in the chart below.

Thickness/Color

Metric Shims

Align, level, and make accurate adjustments to metric components. Stainless steel shims have an ID tolerance of ±0.3 mm, an OD tolerance of ±0.05 mm, and may be mildly magnetic. Plain steel shims have an ID tolerance of ±0.5 mm and an OD tolerance of –0.5 mm.

Type 316 stainless steel shims are more corrosion resistant than 18-8 stainless steel shims. Minimum Rockwell hardness is B70.

18-8 stainless steel shims are more corrosion resistant than spring steel shims. Minimum Rockwell hardness is B85.

Spring steel shims meet DIN 988 and have a minimum Rockwell hardness of B84.

Peel-Away Shims

Make on-the-spot adjustments—just peel away the thin layers until you get the thickness you need. Layers are 0.002″ thick and bonded with adhesive. ID and OD tolerances are ±0.008″. Tolerance for 0.032″ thickness is ±0.005″; for 0.062″ thickness it's +0.006″ to –0.002″; and for 0.125″ thickness it's +0.012″ to –0.003″.

18-8 stainless steel shims offer excellent corrosion resistance. May be mildly magnetic. Min. Rockwell hardness is B75. ***Aluminum*** shims are made from Alloy 1100. Lightweight and nonmagnetic, they're more corrosion resistant than brass, but not rated for hardness. ***Brass*** shims are corrosion resistant, nonmagnetic, and have a min. Rockwell hardness of B59.

Shims for D-Profile Precision Shafts

Shaped to fit. Made from 18-8 stainless steel. ID tolerance is +0.015″; OD tolerance is ±0.005″. Thickness tolerance is ±0.005″. Minimum Rockwell hardness is B80. **To Order:** Please specify thickness: 1/32″, 1/16″, or 1/8″.

Shims for Shafts and Bearings

For spacing of gears and bearings. *Type 316 stainless steel* shims are more corrosion resistant than *18-8 stainless steel* shims (both may be mildly magnetic). *Brass* shims, our softest shims, are nonmagnetic and resistant to mild corrosion. *Alloy steel*, our hardest shims, are Alloy 4140. Stainless steel shims have a minimum Rockwell hardness of B65; for brass it's B60; and for alloy steel it's C40.

Shaft shims fit snug to shafts. ID tolerance is +0.005″. OD tolerance is ±0.005″. Tolerance for 0.001″-0.008″ thicknesses is ±0.0005″ and for 0.010″-0.016″ thicknesses is ±0.001″, except alloy steel shims which have a thickness tolerance of ±0.002″.

Bearing shims fit the outer rim of the bearing. ID tolerance is +0.005″. OD tolerance is –0.005″. Tolerance for 0.003″ to 0.007″ thicknesses is ±0.0005″ and for 0.010″ to 0.020″ thicknesses is ±0.001″.

Shaft Shims

To Order: For stainless steel and brass shims, please specify thickness: 0.001″, 0.002″, 0.003″, 0.004″, 0.005″, 0.006″, 0.008″, 0.010″, 0.012″, 0.014″, or 0.016″. *Note:* Type 316 stainless steel shims are not available in 0.001″, 0.002″, 0.003″, and 0.004″ thicknesses.

Shims for Die Punches

Place these shims under sharpened dies to restore their original height and extend the life of the dies. ID and OD tolerance is ±0.020″. Minimum Rockwell hardness is C44.

0.005″ thick shims are C1095 spring steel. ***0.015″*** and ***0.032″ thick*** shims are C1075 spring steel.

450-Piece Assortment— Contains 25 each of 0.005″ and 0.015″ thicknesses in these ODs: 1/4″, 5/16″, 3/8″, 7/16″, 1/2″, 5/8″, 3/4″, 7/8″, and 1″.

Shims for Shortening Screw Shoulders

Slide onto your screw to shorten the shoulder length.

Type 316 stainless steel shims are more corrosion resistant than 18-8 stainless steel shims. They may be mildly magnetic. Minimum Rockwell hardness is B70. ID tolerance is +0.011″. OD tolerance is ±0.002″.

18-8 stainless steel shims are more corrosion resistant than spring steel shims. They may be mildly magnetic. Not rated for hardness. ID tolerance is +0.011″. OD tolerance is ±0.002″.

Spring steel shims are made from C1075 steel, except shims that are 0.005″ thick, which are C1095 steel. All have a minimum Rockwell hardness of C44. ID tolerance is +0.005″. OD tolerance is –0.005″.

Assortments

198-Piece Spring Steel Assortment— Includes 16 of 0.015″ and 17 of 0.032″ thicknesses in sizes for these shoulder diameters: 1/4″, 5/16″, 3/8″, 1/2″, 5/8″, and 3/4″. Furnished in a plastic box.

91124A600 ..... **Each** $127.87

270-Piece Spring Steel Assortment— Includes 15 each of 0.005″, 0.015″, and 0.032″ thicknesses in sizes for these shoulder diameters: 1/4″, 5/16″, 3/8″, 1/2″, 5/8″, and 3/4″. Furnished in a plastic box.

91124A800 ..... **Each** $102.31

Shims for Lengthening Screw Shoulders

Spin these tight-fitting shims onto your screw's threads to extend shoulder length.

Type 316 stainless steel shims are more corrosion resistant than 18-8 stainless steel shims. They may be mildly magnetic. Minimum Rockwell hardness is B70. ID tolerance is +0.011″. OD tolerance is ±0.002″.

18-8 stainless steel shims are more corrosion resistant than spring steel shims. They may be mildly magnetic. Not rated for hardness. ID tolerance is +0.011″. OD tolerance is ±0.002″.

Spring steel shims are made from C1075-C1095 steel and have a minimum Rockwell hardness of C44. ID tolerance is +0.005″. OD tolerance is –0.005″.

Assortments

270-Piece Spring Steel Assortment—Includes 15 each of 0.005″, 0.015″, and 0.032″ thicknesses in sizes for these shoulder diameters: 1/4″, 5/16″, 3/8″, 1/2″, 5/8″, and 3/4″. Furnished in a plastic box.

91140A800 ..... **Each** $92.76

300-Piece Spring Steel Assortment—Includes fifty 0.015″ thick shims in sizes for these shoulder diameters: 1/4″, 5/16″, 3/8″, 1/2″, 5/8″, and 3/4″. Furnished in a plastic box.

91140A600 ..... **Each** $65.82

300-Piece Assortment

Shims for Shortening Screw Shoulders—Metric

Slide onto metric screws to shorten shoulder length. Shims are made from 18-8 stainless steel, which offers excellent corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B70. ID tolerance is +0.254 mm. OD tolerance is –0.254 mm.

Also Available: C1075 spring steel shims in 0.005″ and 0.01″ thicknesses. To order, please ask for 91437A777 and specify thickness and shoulder diameter.

Shims for Lengthening Screw Shoulders—Metric

Spin these tight-fitting shims onto your screw's threads to extend shoulder length. All shims have an ID tolerance of +0.25″ and an OD tolerance of –0.25″.

18-8 stainless steel shims are more corrosion resistant than spring steel shims and may be mildly magnetic. They have a minimum Rockwell hardness of B70.

Spring steel shims are made from C1075 steel and have a minimum Rockwell hardness of C40.

Wide-Rim Shims

Cover a greater surface area than you can with standard shims. Commonly called machinery bushings, they also reduce friction and wear between moving parts. Shims up to 0.134″ thick have a minimum Rockwell hardness of B20. The 0.187″ thick shims are not rated for hardness.

18-8 stainless steel shims offer excellent corrosion resistance and may be mildly magnetic.

Zinc-plated steel and ***plain steel*** shims are made from C1006-C1020 steel. Zinc plating adds good rust resistance.

Shims for Keyed Drive Shafts

Shims are notched to fit over keyed shafts. Also known as arbor spacers, they're made from C1008-C1010 steel and have a minimum Rockwell hardness of B84. ID tolerance is +0.011″. OD tolerance is ±0.002″. Notch width tolerance is +0.010″ to +0.019″; notch depth tolerance is +0.017″ to +0.052″.

Also Available: 18-8 stainless steel shims. To order, please ask for 98116A777 and specify thickness and ID.

Extra-Thick Shims for Keyed Drive Shafts

Also known as milling machine arbor spacers, these durable shims are thicker than other shims with internal notches. They're made from hardened C4045 steel and have a minimum Rockwell hardness of C40.

ID tolerance is +0.003″. OD tolerance is ±0.005″. Thickness tolerance is ±0.005″. Notch width and depth tolerance is ±0.004″.

Plastic Horseshoe Shims

Plain Shim

Our horseshoe shims are resistant to moisture and color-coded for quick identification.

Plain shims have a maximum temperature of 192° F. Thickness tolerance is ±0.031″. ***Nesting*** shims have grooves that keep them from sliding apart. They have a maximum temperature of 380° F. Thickness tolerance is ±0.01″.

Nesting Shims Shown Stacked

Tapered Shims

Level and align everything from windows to furniture.

Wood shims are scored, and wood/plastic ***composite*** shims are dimpled. Both allow you to snap off any excess.

Plastic shims have ridges that interlock when stacked together. Rigid plastic shims are polypropylene. Flexible plastic shims are polyvinyl, which is vibration resistant and easy to trim.

18-8 Stainless Steel Slotted Shims with Tab

Insertion Tool

260-Piece Assortment

Use the tab to insert, remove, or make adjustments. Shims are etched with thickness. They're made from 18-8 stainless steel for excellent corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B54.

Insertion tools hook onto the tab to give you leverage and reach. They're made from 18-8 stainless steel and are 5″ long.

Type 316 Stainless Steel Slotted Shims with Tab

Shims are more corrosion resistant than those made from 18-8 stainless steel. They have a tab for insertion and removal and are etched with thickness. May be mildly magnetic. Minimum Rockwell hardness is C36.

Insertion tool hooks onto the tab to give you leverage and reach. It's made from 18-8 stainless steel and is 7 1/8″ long.

Aluminum and Plastic Color-Coded Slotted Shims

Shims are color-coded by thickness for easy identification. ***Aluminum*** shims are stronger and more resistant to high temperatures than plastic shims. They're made from rust- and compression-resistant Alloy 1100 or 3003. ***Plastic*** shims are oil resistant. They're made from polyester and have a maximum temperature of 140° F.

Assortments— Include 20 shims in each of these thicknesses: 0.002″, 0.003″, 0.004″, 0.005″, 0.010″, 0.015″, 0.020″, 0.030″, and 0.060″, except aluminum trade size AA and C assortments, which do not include the 0.060″ thickness.

Leveling Shims

Commonly called beveled washers, these shims are designed for structural I-beams.

18-8 stainless steel shims are corrosion resistant and may be mildly magnetic. They meet ASTM B783 and have a minimum Rockwell hardness of B45. ***Aluminum*** shims are made from Alloy 319 and are not rated for hardness. ***Iron*** shims meet ASTM A47. Minimum Rockwell hardness is B62. ***Hardened steel*** shims conform to ASTM F436 for use with A325/A490 structural bolts. They're made from C1035-C1055 steel. Minimum Rockwell hardness is C38. ***Zinc-plated steel*** metric shims meet DIN 435. They're corrosion resistant and not rated for hardness.

Also Available: Galvanized iron shims in 1/4″ -1″ screw sizes. Please ask for 91152A777 and specify screw size.

About Spacers and Standoffs

Use spacers and standoffs to separate or connect parts, and to position components in assemblies. They come in round and hex shapes; choose the hex shape if you need to use a wrench or pliers for grip and torque.

Spacers *are not* threaded. Standoffs *are* threaded. Inch sizes have a Class 2B thread fit, metric sizes have a Class 6h thread fit.

Material Information

18-8 Stainless Steel— Strong, electrically conductive, and nonmagnetic, this stainless steel offers excellent corrosion resistance. It meets ASTM A581 and A582. Minimum Rockwell hardness is B60. Tensile strength is 80,000 psi.

Brass— Like 18-8 stainless steel, it's strong, electrically conductive, nonmagnetic, and corrosion resistant. It can also be soldered for grounding. Brass meets ASTM B16. Minimum Rockwell hardness is B55. Tensile strength is 45,000 psi.

Aluminum— One-third the weight of steel and mildly resistant to corrosion. Minimum Rockwell hardness is B20. Tensile strength is 45,000 psi. *Black-finish aluminum* has an anodized finish that meets MIL-A-8625E.

Steel— Made from 12L14 steel (unless otherwise stated). Minimum Rockwell hardness is B60. Tensile strength is 55,000 psi. *Zinc plating* adds corrosion resistance; *chrome plating* adds a decorative, mirror-like finish.

Nylon 6/6— Nonconductive and resistant to chemicals and solvents (except mineral acids). Withstands temperatures from –40° to +180° F. Absorbs moisture, which can affect dimensions and other properties. Not rated for hardness or tensile strength.

Plastic— *Low-density polyethylene (LDPE)* is nonconductive, noncorrosive, and moisture and chemical resistant. Temperature range is –60° to +175° F. *Polypropylene* is FDA compliant for food contact. It's resistant to chemicals, nonconductive, and has a temperature range of –40° to +160° F. *Acetal* is strong, wear resistant, and chemical resistant. It meets ASTM D4181 and has a temperature range of –40° to +250° F. *PTFE* is low friction, chemical resistant, and a good electrical insulator. Minimum temperature is not rated; maximum temperature is +550° F. Plastic is not rated for hardness or tensile strength.

Rubber— Fabric reinforced and oil resistant, rubber compresses to dampen vibration, shock, and noise. It has a temperature range of –65° to +200° F. Not rated for hardness or tensile strength.

Garolite (G-10/FR4)— This epoxy-grade laminate is a good electrical insulator with high strength and low moisture absorption. Temperature range is 0° to +300° F. Minimum Rockwell hardness is M110. Tensile strength is 35,000 psi.

Hard Fiber— Lightweight, impact resistant, and impervious to most organic solvents and petroleum-based oils. Minimum Rockwell hardness is R50. Tensile strength is 6,000 psi.

Ceramic— Made from Grade L4 or L5 ceramic that maintains tensile and compression strength at high temperatures and in high-voltage applications. Minimum temperature is not rated; maximum temperature is +1700° F. Not rated for hardness or tensile strength.

Unthreaded Spacers

Also called clearance spacers. They have an OD tolerance of ±0.005″, ID tolerance of +0.01″, and length tolerance of ±0.005″, except nylon. Nylon have an OD tolerance of ±0.015″, ID tolerance of ±0.005″, and length tolerance of ±0.015″. Nylon is off-white.

★ Prices are 15% lower when you buy in multiples of 10.

Adjustable Unthreaded Spacers

The lengthwise split allows expansion when you need flexibility. Spacers can also be used as tension sleeves. They're made from low-strength zinc-plated steel. ID tolerance is +0.008″ and length tolerance is ±0.005″. OD tolerance is not available.

Chrome-Plated Steel Unthreaded Spacers

Made from polished nickel-chrome-plated steel, these round spacers are a must when appearances matter. They're long-wearing and tarnish resistant. OD, ID, and length tolerances are ±0.01″.

For information about spacers and standoffs, see page 3254.

Plastic Unthreaded Spacers

Space components with the nonconductive and chemical-resistant properties of plastic.

Low-density polyethylene (LDPE) spacers have OD and ID tolerances of ±0.015″ for ODs up to ½″ and ±0.025″ for ODs over ½″. Length tolerance is ±0.062″ for lengths up to 2″ and ±0.09″ for lengths over 2″.

Polypropylene spacers have OD and ID tolerances of ±0.015″ for ODs up to ⅜″ and ±0.025″ for ODs over ⅜″. Length tolerance is ±0.062″.

Acetal spacers have an OD tolerance of ±0.01″, ID tolerance of +0.01″, and length tolerance of ±0.01″.

245-Piece Nylon Shoulder Spacer Assortment

Includes spacers in a variety of barrel lengths for the following screw sizes: 40 for No. 2, 50 for No. 4, 30 for No. 6, 40 each for No. 8 and No. 10, 30 for 1/4″, and 15 for 5/16″. Made from off-white nylon 6/6. Furnished in a plastic box.

90062A600 ..... **Each** $35.62

Unthreaded Spacers for Angled Surfaces

The 45° end fits against angle iron and other angled surfaces. OD and ID tolerances are ±0.01″. Length tolerance is ±0.02″.

To Order: Please specify material: Type 316 stainless steel, plain steel, or nylon.

Unthreaded Curved Spacers for Tubes

Also known as saddle washers, spacers have a concave end that fits snugly against curved items such as tube and pipe. Made from off-white nylon 6/6, they have an ID tolerance of ±0.005″ and OD and length tolerances of ±0.015″.

For information about spacers and standoffs, see page 3254.

Captive Unthreaded Spacers

Press these 18-8 stainless steel spacers to panels as thin as 0.06″. They resist pushing, pulling, and twisting forces thanks to splines that cut into the material they're mounted in. Both ends are open. To install, drill a hole in your panel and use an arbor press (sold separately on pages 2327-2328).

Spacers meet MIL-S-7742, Class 2B. Length does not include splined portion. Length and OD tolerances are ±0.005″. ID tolerance is +0.004″. Not rated for hardness.

Press-Fit Bolt Liners

Reinforce bolt holes with zinc-plated steel split-seam liners. Beveled ends aid insertion.

Liners ***for metal*** protect bolts from sideways pressure. Length tolerance is –0.003″; OD tolerance is ±0.005″. Liners ***for plastic,*** also known as compression limiters, keep plastic components from getting crushed when bolts are tightened. Length tolerance is –0.01″; OD tolerance is –0.016″.

Female Threaded Hex Standoffs

Fully Threaded

Partially Threaded

Tighten with a wrench or pliers—the flat sides ensure you'll get a firm grip. Hex tolerance is ±0.005″. Length tolerance is ±0.005″ for standoffs up to 4″ long. Longer lengths have a tolerance of ±0.008″, except longer lengths of nylon, which have a tolerance of ±0.01″. Nylon is off-white.

Standoffs are fully threaded, except the lengths listed in the chart, which are partially threaded.

Female Threaded Hex Standoffs *(Continued from previous page)*

Fully Threaded

Partially Threaded

Tighten with a wrench or pliers—the flat sides ensure you'll get a firm grip. Hex tolerance is ±0.005″. Length tolerance is ±0.005″ for standoffs up to 4″ long. Longer lengths have a tolerance of ±0.008″, except longer lengths of nylon, which have a tolerance of ±0.01″. Nylon is off-white.

Standoffs are fully threaded, except the lengths listed in the chart, which are partially threaded.

Metric Female Threaded Hex Standoffs

Fully Threaded

Partially Threaded

Install our metric standoffs with a wrench or pliers—your tool won't slip on the flat sides. Hex and length tolerances are ±0.13 mm.

Standoffs are fully threaded, except the lengths listed in the chart, which are partially threaded.

Vibration-Damping Standoffs

Designed for the miniature cooling fans found in compact electronics, these mounts prevent the transfer of vibration. Made from an elastomer with a durometer hardness of 56A. Temperature range is 55° to 105° F. Color is blue.

For information about spacers and standoffs, see page 3254.

Female Threaded Round Standoffs

The smooth surface keeps your work looking clean and professional. OD and length tolerances are ±0.005″. Nylon is off-white.

Standoffs up to 1″ long are fully threaded, except 18-8 stainless steel standoffs with a 4-40 screw size, which are fully threaded up to ¾″ long. All others are partially threaded (see chart for thread lengths).

Fully Threaded

Partially Threaded

For information about spacers and standoffs, see page 3254.

Female Threaded Swage Round Standoffs

Separate circuit boards and other components with permanent, swage-in-place standoffs. Made from zinc-plated brass. Body has a 1/4″ OD. Body OD and length tolerances are ±0.005″. Swage end has a 0.188″ OD; tolerance is –0.003″. Fully threaded.

Also Available: Swage tools for installation. For punch, please ask for 93500A555 and specify body length. For anvil, please ask for 93500A888 and specify body length.

Captive Female Threaded Round Standoffs

For panel hardware that won't push, pull, or twist out, try these 18-8 stainless steel standoffs. Install in a hole with an arbor press (sold separately on pages 2327-2328). All meet MIL-S-7742. Length and body OD tolerances are ±0.005″. Not rated for hardness.

(A&B) Clinch style standoffs have a recess under the hex that pinches panel material. When mounted, the hex sits flush with the surface. Length includes hex.

(C) Splined style standoffs have ridges that bite into panel material. When mounted, a portion of the standoff sits slightly above the surface. Length does not include the splined segment.

Metric Male-Female Threaded Hex Standoffs

Connect metric male threads to metric female threads. Threads are the same size on both ends. Install with a wrench or pliers—the flat hex surface ensures a firm grip. Hex and length tolerances are ±0.15 mm. Nylon is off-white.

Screw Size	Thread Lengths: Male (B)	Female (C)
M2.5	3.9 mm	Up to 4.8 mm
M3	4.7 mm	Up to 6.4 mm
M3.5	6.3 mm	Up to 9.5 mm
M4	9.5 mm	Up to 11.1 mm
M5	9.5 mm	Up to 12.7 mm

Panel Standoffs

Round

Square

Give mounted glass and other display panels an updated look. Standoffs are aluminum and include a barrel, cap, and set screw. Not rated for hardness or tensile strength. Mounting hardware for round standoffs is sold separately. Square standoffs include a threaded stud for mounting.

Also Available: Black aluminum square standoffs. Please ask for 92082A555 and specify square size and length.

Mounting Hardware for Round Standoffs

Toggle bolt anchors include one steel headless toggle bolt. Use in drywall up to 3/4″ thick. 94706A992 requires a 1/2″ dia. hole; 94706A990 requires a 7/8″ dia. hole.

Threaded anchors include one steel threaded stud.

Panel Supports

Space 1/16″ thick circuit boards and other panels with our nylon 6/6 supports. Color is off-white. Length tolerance is ±0.015″.

Screw Mount— Great for tight spaces. Snap the post into a 5/32″ dia. hole and secure with a No. 6 sheet metal screw (not included). Supports are not reusable.

Lock Mount— Snap the post into a 3/16″ dia. hole. "Wings" provide tension, which adds strength to the connection.

Edge-Grip Panel Standoffs

Hang display panels without drilling into them. Standoffs are aluminum. Each includes a barrel with mounting screw and a nylon-tipped set screw under a removable cap. Tighten the set screw to hold panel in place. Not rated for hardness or tensile strength. Use optional mounting hardware (sold separately) to mount into drywall and wood.

Standoffs

Max. Panel Thick.	(A)	(B)	(C)

Wood	3/4″	**98173A920**	.21
Wood	1 1/4″	**98173A930**	.32

Peg-Style Panel Standoffs

Use four standoffs to mount panels, or use a single standoff as a decorative hook. Each comes with a wall anchor. Not rated for hardness or tensile strength.

Aluminum standoffs have a brushed finish. ***Acrylic*** standoffs are translucent with a frosted finish and a temperature range of 0° to 120° F.

18-8 Stainless Steel Male-Female Thread Adapters

Connect male and female threads of different sizes. Adapters are made from 18-8 stainless steel, which may be mildly magnetic and meets ASTM 581. Inch male threads have a Class 2A thread fit, female have Class 2B. Metric male threads have a Class 6g thread fit; female have Class 6H. All have a minimum Rockwell hardness of B83 and minimum tensile strength of 85,000 psi. Hex and length tolerances are ±0.01″ (±0.254 mm).

Also Available: Heat-treated steel adapters in sizes marked with a ♣. Please ask for 94402A770 and specify male and female screw sizes.

18-8 Stainless Steel Male-Male Thread Adapters

Make a secure connection between female threads. Adapters are made from 18-8 stainless steel, which may be mildly magnetic. Inch threads have a Class 2A thread fit; metric threads have Class 6g. All have a minimum Rockwell hardness of B83 and minimum tensile strength of 85,000 psi. Hex and length tolerances are ±0.01″ (±0.254 mm).

External Retaining Rings

1/8″ to 15/64″ 1/4″ to 10″

Pull rings open to pass over the end of a shaft and release to spring into the groove. They meet ASME B18.27.1 and are magnetic.

Black-finish and ***zinc and yellow chromate-plated steel*** rings have a minimum Rockwell hardness of C40. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel. Minimum Rockwell hardness is C43.

Nonmagnetic External Retaining Rings

Made of beryllium copper, rings are nonmagnetic, corrosion resistant, and electrically conductive. They meet ASME B18.27.1. Minimum Rockwell hardness is C36 for shaft diameters 5/16″ and larger (1/8″-1/4″ shaft diameters are not rated).

Metric External Retaining Rings

Rings meet DIN 471. ***Black-finish steel*** rings have a minimum Rockwell hardness of C44. ***Stainless steel*** rings are made of DIN 1.4122 stainless steel, which has similar properties to 400 series. They are magnetic and have a minimum Rockwell hardness of C47.

For retaining ring pliers and tools, see pages 2758-2760.

Military Specification External Retaining Rings

Meets stringent military specification MS 16624.

Cadmium-plated steel rings have better corrosion resistance than zinc. Minimum Rockwell hardness is 45N 52 for shaft diameters up to 1.5″ and C46 for shaft diameters 1.625″ and larger.

Stainless steel rings are made of Type 15-7 PH stainless steel, which is more corrosion resistant than cadmium-plated steel. They're magnetic and passivated in accordance with QQ-P-35. Minimum Rockwell hardness is 30N 63 for shaft diameters up to 0.812″ and C44 for shaft diameters 0.875″ and larger.

Heavy Duty External Retaining Rings

Rings are thicker than standard external retaining rings. They meet ASME B18.27.2.

Black-finish steel rings have a minimum Rockwell hardness of C47. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel, which is magnetic. Minimum Rockwell hardness is C44.

Spiral External Retaining Rings

Install these coiled rings by winding them into the groove on a shaft. No tools are required for installation so they're ideal for tight spaces. Rings have 360° contact with the shaft so there is no gap. Not rated for hardness.

Stainless steel rings are made of 18-8 stainless steel and may be mildly magnetic.

Easy-to-Install Spiral External Retaining Rings

Also called single-turn rings, install by sliding them into the groove on a shaft with one twist. Thinner than standard rings, they fit into smaller grooves. They are not rated for hardness.

Stainless steel rings are made of 18-8 stainless steel and may be mildly magnetic.

Self-Locking External Retaining Rings

No groove required for installation. Rings dig in to the shaft material, so expect minor scratching. Use with an unhardened shaft. They're tougher to remove compared to standard retaining rings.

Black-finish steel rings have a minimum Rockwell hardness of C47 for shaft diameters 1/4″ and larger (3/32″-3/16″ shaft diameters are not rated).

Stainless steel rings are made of Type 15-7 or 17-7 PH stainless steel, which is magnetic. Minimum Rockwell hardness is C44 for shaft diameters 1/4″ and larger (3/32″-3/16″ shaft diameters are not rated).

Zinc and Yellow Chromate-Plated Steel.. 98552A040 48.59

300-Piece Self-Locking Black-Finish Steel— 12 sizes for shaft diameters: 1/8″, 3/16″, 1/4″, 5/16″, 3/8″, 7/16″, 1/2″, 9/16″, 5/8″, 3/4″, 7/8″, and 1″.

98430A500 ..... $66.82

540-Piece External/E-Style Black-Finish Steel— 23 sizes. 265 external rings for shaft diameters: 5/16″, 3/8″, 7/16″, 1/2″, 5/8″, 3/4″, 15/16″, 63/64″, 1″, 1 1/8″, 1 1/4″, 1 3/8″, and 1 1/2″, plus 275 side-mount (E-style) rings for shaft diameters: 1/8″, 3/16″, 1/4″, 5/16″, 3/8″, 7/16″, 1/2″, 5/8″, 3/4″, and 7/8″. Includes external ring pliers.

93352A660 ..... $137.59

630-Piece— 25 sizes for shaft diameters: 1/8″, 3/16″, 1/4″, 5/16″, 3/8″, 7/16″, 1/2″, 9/16″, 5/8″, 3/4″, 13/16″, 7/8″, 1″, 1 1/8″, 1 1/4″, 1 5/16″, 1 3/8″, 1 1/2″, 1 5/8″, 1 3/4″, 2″, 2 1/4″, 2 1/2″, 2 5/8″, and 3″.

Black-Finish Steel 92389A730 $75.20
Zinc and Yellow Chromate-Plated Steel.. 92389A410 91.95

Side-Mount External Retaining Rings (E-Style)

Snap rings into the groove from the side of the shaft. Their three prongs make contact with the shaft and provide a wider shoulder than other external retaining rings for a larger retaining surface. They are magnetic.

Black-finish and ***zinc and yellow chromate-plated steel*** rings have a minimum Rockwell hardness of C47. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel. Minimum Rockwell hardness is C44.

Also Available: Nonmagnetic beryllium copper rings in sizes marked with a ♦. Please ask for 92725A500 and specify shaft diameter.

Metric Side-Mount External Retaining Rings (E-Style)

Rings meet DIN 6799. They snap directly into the groove from the side of the shaft. The three prongs make contact with the shaft and provide a wider shoulder than other external retaining rings. They are magnetic.

Black-finish steel rings have a minimum Rockwell hardness of C46. ***Stainless steel*** rings are made of DIN 1.4122 stainless steel, which has similar properties to 400 series. Minimum Rockwell hardness is C44, unless noted.

▲ Not rated for hardness.

Heavy Duty Side-Mount External Retaining Rings

Style 1

Style 2

Rings are wider than our standard side-mount retaining rings to provide a larger retaining surface.

Black-finish steel rings have a minimum Rockwell hardness of C47. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel. They have a minimum Rockwell hardness of C43 and are magnetic.

Style 1 rings are interchangeable with standard side-mount (E-style) rings and meet ASME B18.27.2. ***Style 2*** rings, also known as clip or poodle rings, are thicker and have wide "ears" that form an extra-wide retaining surface.

Bowed Side-Mount External Retaining Rings

Also known as bowed E-style rings, their concave design provides spring-like retention for a tight hold. They snap directly into the groove from the side of the shaft. Rings are made of steel and have a black finish. They meet ASME B18.27.3. Minimum Rockwell hardness is C47, except 1/8" shaft diameter is not rated.

Crimp-On External Retaining Rings

Commonly called X-washers, install these rings using any standard pliers. Place into the groove and squeeze tight to form a 360° closure. To remove, squeeze tabs on the opposite side of the opening.

Zinc-plated steel rings have a Rockwell hardness of B60. ***Stainless steel*** rings are made of 18-8 stainless steel which, may be mildly magnetic. Minimum Rockwell hardness is B82.

Side-Mount External Retaining Ring Assortments

Assortments come in a compartmented plastic box with lid chart, unless noted.

225-Piece Low-Clearance Zinc-Plated Steel— 9 sizes for shaft diameters: 7/32", 1/4", 9/32", 5/16", 3/8", 7/16", 1/2", 5/8", and 3/4".

98555A070 ..... $32.81

265-Piece E-Style— 12 sizes for shaft diameters: 1/8", 5/32", 3/16", 7/32", 1/4", 5/16", 3/8", 7/16", 1/2", 5/8", 3/4", and 7/8".

Zinc and Yellow Chromate-Plated Steel.. 98554A060 $37.11
Stainless Steel..... 98460A212 142.93

300-Piece Metric E-Style Black-Finish Steel— 12 sizes for shaft diameters: 3 mm, 4 mm, 5 mm, 6 mm, 7 mm, 8 mm, 9 mm, 10 mm, 11 mm, 13 mm, 16 mm, and 20 mm.

98554A660 ..... $29.38

555-Piece E-Style Zinc and Yellow Chromate-Plated Steel— 18 sizes for shaft diameters: 1/8", 5/32", 3/16", 7/32", 1/4", 5/16", 3/8", 7/16", 1/2", 5/8" and 3/4", plus heavy duty steel rings for shaft diameters: 3/16", 7/32", 1/4", 5/16", 3/8", 7/16", and 1/2".

98554A070 ..... $72.40

1,500-Piece E-Style Black-Finish Steel— 19 sizes for shaft diameters: 1/16", 3/32", 7/64", 1/8", 9/64", 5/32", 11/64", 3/16", 7/32", 1/4", 5/16", 3/8", 7/16", 1/2", 5/8", 3/4", 7/8", 63/64", and 1 3/16". Comes in a plastic carrying case that holds four boxes.

98554A090 ..... $85.31

Low-Clearance Side-Mount External Retaining Rings

Also known as crescent rings, these are ideal where space and access is limited and a large shoulder is not required. They meet ASME B18.27.2.

Black-finish steel and ***zinc and yellow chromate-plated steel*** have a minimum Rockwell hardness of C47 for shaft diameters 7/32" and larger (shaft diameters 1/8"-3/16" are not rated).

Stainless steel rings are Type 15-7 or 17-7 PH and magnetic. Minimum Rockwell hardness is C43 for shaft diameters 7/32" and larger (shaft diameters 1/8"-3/16" are not rated).

Internal Retaining Rings

Compress rings into the groove inside a bore or housing. Once installed, they provide a shoulder to hold components in place. All rings meet ASME B18.27.1 and are magnetic.

Black-finish and ***zinc and yellow chromate-plated steel*** rings have a minimum Rockwell hardness of C40. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel. Minimum Rockwell hardness is C43.

Also Available: Nonmagnetic beryllium copper rings in sizes marked with a ♣. Please ask for 91482A100 and specify bore diameter.

For retaining ring pliers and tools, see pages 2758-2760.

Metric Internal Retaining Rings

Rings meet DIN 472. Compress rings into the groove of a bore or housing. Once installed, they provide a shoulder to hold components in place.

Black-finish steel rings have a minimum Rockwell hardness of C44. ***Stainless steel*** rings are made of DIN 1.4122 stainless steel, which has similar properties to 400 series and is magnetic.

Easy-to-Install Spiral Internal Retaining Rings

Install with one twist into the groove inside a bore or housing. Also called single-turn rings, they are thinner than standard retaining rings. They are not rated for hardness.

Stainless steel rings are made of 18-8 stainless steel and may be mildly magnetic.

Self-Locking Internal Retaining Rings

No groove required for installation. Rings dig into the shaft material, so expect minor scratching. Use with an unhardened shaft. They're tougher to remove compared to other retaining rings. Rings for bore diameters 5/16″-5/8″ are 0.01″ thick; ¾″ and larger rings are 0.015″ thick.

Black-finish steel rings have a minimum Rockwell hardness of C47. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel, which is magnetic. Minimum Rockwell hardness is C44.

180-Piece Stainless Steel—12 sizes for bore diameters: ¼″, 5/16″, ⅜″, 7/16″, ½″, 9/16″, ⅝″, ¾″, ⅞″, 1″, 1⅛″, and 1¼″.

91605A212 ..... $232.62

240-Piece Metric Black-Finish Steel—12 sizes for bore diameters: 8 mm, 9 mm, 10 mm, 11 mm, 12 mm, 14 mm, 16 mm, 18 mm, 20 mm, 24 mm, 28 mm, and 32 mm.

98365A260 ..... $84.37

261-Piece Black-Finish Steel—20 sizes for bore diameters: ¼″, ½″, ⅝″, 11/16″, ¾″, ⅞″, 1″, 1⅛″, 1¼″, 1⅜″, 1 7/16″, 1½″, 1 9/16″, 1⅝″, 1¾″, 1⅞″, 2″, 2⅛″, 2¼″, and 2½″.

98553A470 ..... $58.13

300-Piece Self-Locking Black-Finish Steel—12 sizes for bore diameters: 5/16″, ⅜″, 7/16″, 0.44″, ½″, 9/16″, ⅝″, ¾″, ⅞″, 15/16″, 1″, 1¼″.

98435A600 ..... $63.03

333-Piece Zinc and Yellow Chromate-Plated Steel—25 sizes for bore diameters: ⅜″, 7/16″, ½″, ⅝″, 11/16″, ¾″, 13/16″, ⅞″, 1″, 1 1/16″, 1⅛″, 1¼″, 1⅜″, 1½″, 1⅝″, 1¾″, 1⅞″, 2″, 2¼″, 2⅜″, 2½″, 2⅝″, 2¾″, 2⅞″, and 3″.

98553A060 ..... $74.91

395-Piece Zinc and Yellow Chromate-Plated Steel—24 sizes for bore diameters: ¼″, ⅜″, 7/16″, ½″, 9/16″, ⅝″, ¾″, 0.777″, 13/16″, ⅞″, 0.901″, 15/16″, 1″, 1.023″, 1 1/16″, 1⅛″, 1 3/16″, 1¼″, 1 5/16″, 1⅜″, 1 7/16″, 1½″, 1 9/16″, and 1⅝″. Includes one pair of internal pliers.

98411A660 ..... $141.72

Combined External/Internal Retaining Ring Assortments

126-Piece Zinc and Yellow Chromate-Plated Steel External/Internal—20 sizes; 60 external rings for shaft diameters: 15/16″, 1″, 1 1/32″, 1 1/16″, 1⅛″, 1 3/16″, 1¼″, 1 5/16″, 1⅜″, and 1 7/16″, plus 66 internal rings for bore diameters: 1 1/16″, 1⅛″, 1 3/16″, 1¼″, 1 5/16″, 1⅜″, 1 7/16″, 1½″, 1 9/16″, and 1⅝″. Includes one pair of external/internal pliers.

98605A020 ..... $84.37

216-Piece Spiral—12 external rings and 12 internal rings for bore/shaft diameters: ½″, ⅝″, ¾″, ⅞″, 1″, 1⅛″, 1¼″, 1⅜″, and 1½″.

Steel ..... 91665A120 ... $114.53
Stainless Steel ..... 91650A200 ... 282.82

220-Piece External/Internal—20 sizes; 105 external rings for shaft diameters: ¼″, 5/16″, ⅜″, 7/16″, ½″, ⅝″, 11/16″, ¾″, ⅞″, and 1″, plus 115 internal rings for bore diameters: ⅜″, 7/16″, ½″, 9/16″, ⅝″, ¾″, ⅞″, 1″, 1⅛″, and 1¼″. Includes one pair of external/internal pliers.

Zinc and Yellow Chromate-Plated Steel ..... 98605A010 ... $77.19
Stainless Steel ..... 98645A220 ... 298.74

380-Piece Black-Finish Steel External/Internal and E-Style—22 sizes; 120 external rings and 120 internal rings for shaft diameters: 8 mm, 10 mm, 12 mm, 14 mm, 16 mm, 18 mm, and 20 mm, plus 140 E-style rings for shaft diameters 3 mm, 4 mm, 5 mm, 6 mm, 7 mm, 8 mm, 10 mm, and 12 mm. Includes one pair of external/internal pliers.

93352A100 ..... $151.45

1,000-Piece Black-Finish Steel External/Internal—20 sizes; 550 external rings for shaft diameters: ¼″, 5/16″, ⅜″, 7/16″, ½″, 9/16″, ⅝″, ¾″, ⅞″, 1″, and 1⅛″, plus 450 internal rings for bore diameters: ⅜″, 7/16″, ½″, 9/16″, ⅝″, ¾″, ⅞″, 1″, and 1⅛″. Also includes one pair of external pliers, one pair of internal pliers, and replacement tips.

98605A001 ..... $144.04

About Captive Fasteners

A captive fastener consists of a screw that's attached to an outer panel, which means you don't have to use hinges, latches, and other hardware that could easily be lost. They provide fast and easy access to panels that require infrequent but complete removal.

Retractable Captive Screws

When unfastened, threads will partially retract. Unfasten screws manually or use a Phillips screwdriver for easier access in hard-to-reach places. Body is 400 series stainless steel; knob is 3000-6000 series aluminum. Ferrule is aluminum for snap-in and flare-in styles and zinc-plated steel for press-in style. Internal spring is Type 302 stainless steel. Screws are used with press-in flush captive nuts (sold separately; see 94674A on page 3213).

Snap-In Style— Provides easy hand installation into thin panels.

Press-In Style— Designed for sheet metal panels with a Rockwell hardness of B85 or softer. Using an arbor press or similar tool, press the screw into the panel until only the top of the press-in ribs are visible.

Flare-In Style— Ideal for near-edge applications and thicker panels. Requires less installation force than press-in style. To install, insert flare-in installation tool (required; sold separately) in an arbor press. Insert screw assembly into prepared hole in panel (requires a 90° flared hole). Center tool over screw thread and flare ferrule into panel.

Retractable Narrow-Body Captive Screws

A slim design makes these screws perfect for confined areas. When unfastened, screw has an internal spring that retracts flush with the back side of the outer panel. All have a knurled Phillips drive head that tightens by hand or with a screwdriver. Body and spring are 18-8 stainless steel; screw is Type 430 stainless steel. Screws are used with press-in flush captive nuts (sold separately; see 94674A on page 3213).

Press-In Style— Designed for sheet metal panels with a Rockwell hardness of B85 or softer. Use an arbor press or similar tool for installation.

Flare-In Style— Ideal for near-edge applications and thicker panels. Requires less installation force than press-in style. To install, insert flare-in installation tool (required; sold separately) in an arbor press. Insert screw assembly into prepared hole in panel (requires a 90° flared hole). Center tool over screw thread and flare ferrule into panel.

Retractable Captive Panel Pins

Spring-loaded pins quickly retract to release sliding parts. Just pull the knob to withdraw the pin from inner panel. For use as a locator or hinge pin on removable doors. Pins *with hold-open* keep the plunger in the retracted position when you pull and rotate it 90°. To determine pin projection into your inner panel, subtract your outer panel thickness from dimension (B) shown in table. For the thread-in panel pin, you'll need to add 0.030″ to your outer panel thickness to allow for the threaded sleeve.

Press-In Style— Use an arbor press to insert into a panel. Knob is nickel-plated steel; stud is zinc-plated C1006 steel.

Thread-In Style— Manually insert pin into panel; thread on sleeve nut and tighten using installation wrench (sold separately). Knob is 6262-T9 aluminum; pin is zinc-plated 12L14 steel.

For information about captive fasteners, see page 3279.

Flush-Mount Captive Screws

Phillips

Unfastened

(Nut Sold Separately)

Fastened

When fastened, the heads of these screws are protected inside an 18-8 stainless steel shell that mounts flush against the outer panel's surface. Use an arbor press or punch to install screws into aluminum and low-carbon steel panels. Screws are used with press-in flush captive nuts (sold separately; see 94674A on page 3213).

Push/Pull Plastic Captive Fasteners

This two-piece fastener is ideal for quick-access applications. Just press the grommet into the outer panel and then insert plunger into the grommet. Push the plunger all the way in, forcing it to expand and lock the panels together; pull to release. Plungers are black nylon; grommets are black polycarbonate. Temp. range is –20° to +185° F. Total installation thickness is the outer plus the inner panel thicknesses. Meet UL 94V2. Each package includes 10 plungers and 10 grommets.

Expandable-Bushing Captive Fasteners

Fastened

Flip the toggle to quickly and easily fasten and unfasten panels. To install, push the threaded end through the hole in the outer panel, slide on the bushing, and tighten the nut. Then, insert assembly through the inner panel hole and flip the handle. The rubber bushing expands radially to draw the panels together. Use for fastening panels with misaligned or blind holes and when vibration could be a problem. Handle and nut are black nylon. 90702A810 has a cast zinc screw, and 90702A910 has a brass screw; both are zinc-plated with a black finish. Bushing is black SBR (styrene-butadiene) rubber. Temperature range is not rated. Total installation thickness is the outer plus the inner panel thicknesses.

Outer Panel Thick.	Total Install. Thick.	*Panel Hole Size* Outer, Ht. × Wd.	Inner, Dia.	(A)	(B)	(C)	(D)	Toggle Width

Quick-Threading Captive Screws and Nuts

Unfastened

Fastened

A special "fast-lead" design means these screws thread twice as fast as standard screws, allowing quick access to panels. A complete fastener consists of a screw with retainer and a nut (sold separately).

For line art, extra dimensions, and product materials, go to mcmaster.com and search for **94220AAC**.

Screws with Retainers

Screws are held captive in the outer panel by a retainer. Each screw includes a nylon wear washer to prevent it from marring the panel. Sold in packages of four (unless noted) zinc-plated C1008 steel screws with four 18-8 stainless steel retainers. Screw diameter is 0.230″. Head diameter is 1/2″. Screw head height is 7/16″ for knurled slotted and 7/64″ for slotted. To select the correct screws and retainers, calculate the installation thickness using the following formulas:

- *Flat Nuts*: Installation Thickness = Inner Panel + Outer Panel + 0.015″
- *Press-In Nuts*: Installation Thickness = Inner Panel + Outer Panel – 0.050″
- *Clip-On Nuts*: Installation Thickness = Inner Panel + Outer Panel + 0.045″

Flat Nut Rivet Style

Flat Nut Weld Style

Nuts

Nuts attach to the inner panel. Package quantity is four.

Flat— Can be used anywhere in panel. *Rivet-style* nuts are C1064 zinc-plated steel and have 0.105″ rivet holes. *Weld-style* nuts are 18-8 stainless steel.

Press In— Use for metal panels that have a Rockwell hardness of B85 or softer. To install, use an arbor press or similar tool and press the nut into the hole until the top is barely visible. Made of zinc-plated 12L14 case-hardened steel.

Clip On— For quick installation near panel edges. Made of zinc-plated C1064 steel.

For information about captive fasteners, see page 3279.

Quarter-Turn Captive Fasteners

A quarter-turn of the stud quickly fastens and removes access panels, doors, and covers. To select a fastener, choose a stud with retainer and then choose a nut style (studs with retainers and nuts sold separately).

ⓘ For additional information such as line art, extra dimensions, and product materials, go to mcmaster.com and search for **93450AAC**.

Studs with Retainers

Studs are held captive in outer panel by retainers (retainer installation tool sold separately). Each package includes 10 studs with 10 retainers. To select the correct stud, calculate installation thickness (see formulas below). Then find nut style and thickness in the table. Follow the row across to locate compatible studs. Studs are zinc-plated C1008 steel and have a diameter of 0.240″. Retainers are Type 304 stainless steel. Studs fit an outer panel hole size of ¼″.

- *Clip-On Nuts*:
  When space between panels is 0.025″ thick or less,
  Installation Thickness = Inner Panel + Outer Panel + 0.055″
  OR When space between panel and frame is 0.026″ thick or greater,
  Installation Thickness = Inner Panel + Outer Panel + 0.030″
- *Leaf-Spring* and *Back Press-In Nuts*:
  Installation Thickness = Inner Panel★ + Outer Panel + Space
  ★ When using back press-in nuts, if inner panel is less than 0.051″ thick, substitute 0.051″ for inner panel thickness.
- *Front Press-In Nuts*:
  Installation Thickness = Outer Panel + Space

Nuts

Nuts attach to the inner panel. Choose a style based on your application.

Clip On—For quick installation near inner panel edges.

Leaf Spring—Can be used when the back of the inner panel is accessible. *Rivet* style uses 3/32″ rivets; *weld* styles require a welding clamp (see pages 2578-2581 for welding clamps).

Press In—For use with metal panels. Install with an arbor press or similar tool. *Back press-in* styles are for use when the back of the inner panel is accessible; use *front press-in* styles when back is inaccessible.

Replacement Retainers (10/pkg.)	93450A437	Pkg.	$1.03

Plastic Quarter-Turn Captive Fasteners

Designed like the captive fasteners above, these lightweight plastic fasteners withstand extreme temperatures and corrosive environments. A complete fastener consists of a stud, retainer, and nut (each sold separately). Temperature range is –40° to +194° F continuous; to +248° F intermittent. Color is black.

ⓘ For additional information such as line art, extra dimensions, and product materials, go to mcmaster.com and search for **93442AAC**.

Studs

To select the correct studs, calculate the installation thickness using the formulas below. Then locate the nut style and thickness in the table. Follow the row across to locate the compatible studs. Package quantity is 10.

- *Rivet-In Nuts*:
  Installation Thickness =
  Inner Panel + Outer Panel +
  Space + (Rivet Head Thick.
  OR Retainer Thick.■)
  ■ Use the greater thickness.
- *Clip-On Nuts*:
  Installation Thickness =
  Inner Panel + Outer Panel +
  Space + 0.079″

Nuts

Rivet-in nuts mount permanently anywhere. Package quantity is 10.

Clip-on nuts are for quick installation near panel edges. They are for use with a 0.027″-0.090″ inner panel thickness. Package quantity is 5.

Inner Panel Hole Dia.	Rivet In	Pkg.	Clip On	Pkg.
0.512″-0.600″	93442A212	$9.87	93442A223	$7.30

Retainers

Retainers hold studs to outer panel. Buy one retainer for every stud/nut combination. Thickness is 0.045″. Package quantity is 10.

93442A311 ..... Pkg. $4.40

18-8 Stainless Steel Helical Inserts

Repair threads with these corrosion-resistant coil inserts to restore parts that would otherwise have to be scrapped. Once installed, each spring-like coil expands to permanently anchor the insert. Insert length in table refers to installed length. Rockwell hardness is C42-C50. Minimum tensile strength is 200,000 psi.

Standard inserts provide a smooth free-running thread. All inch inserts meet MS-122 or MS-124 except 91732A021, A023, A731, 92335A111, A115, A119, 92090A (left-hand thread), and 91733A (NPT).

Screw-lock inserts put a self-locking pressure on the bolt, so you don't need other thread-locking devices. Resist impact and vibration. All inch inserts meet Mil. Spec. series 21209 except 90296A037 and 90296A038. Inch inserts are dyed red for easy identification.

Insert taps are straight flute plug style and made of high-speed steel.

Repair kits include standard inserts, one insert tap, one installation tool, one high-speed drill bit to fit ½″ chuck (unless noted), and instructions.

Also Available: High-speed steel bottoming taps for blind holes. Please ask for 91709A555 and specify internal thread size.

To Install—*Drill* hole using bit size shown in table. *Tap* using screw thread insert tap. Drills and taps are sold separately. Screw the insert onto the installation tool (see page 3285 for tools). The tang (the prong the tool grips during installation) must be properly engaged in the tool's driving contour. Install the insert ¼ to ½ turn below the work surface of the hole. You must *remove tang* to allow full passage of screw into the insert.

● Dyed red for easy identification.

Antiseizing Helical Inserts

There's no need to lubricate these gall-resistant inserts. Galling, also called seizing, is when two metals stick together and cannot be easily loosened. Inserts reduce friction to minimize thread wear with no additional plating or coating required. They are nonmagnetic and made of superior corrosion-resistant 18-8 stainless steel (also known as Nitronic 60). Compatible with stainless steel screws. Rockwell hardness is C43-C50. Tensile strength is approximately 200,000 psi.

Standard inserts provide a smooth free-running thread.

Screw-lock inserts put a self-locking pressure on the bolt so you don't need other threadlocking devices. They resist impact and vibration.

Master Helical Insert Assortments

Each includes 18-8 stainless steel helical inserts, drill bit, tap, installation tool for each size, and instructions in a molded plastic case.

Coarse Thread—*54 Inserts.* Sizes: 1/4″-20×3/8″, 5/16″-18×15/32″, 3/8″-16×9/16″, 7/16″-14×21/32″, 1/2″-13×3/4″, and 5/8″-11×15/16″.

90285A121 ..... $424.27

Fine Thread—*60 Inserts.* Sizes: 10-32×0.285″, 1/4″-28×3/8″, 5/16″-24×15/32″, 3/8″-24×9/16″, 7/16″-20×21/32″, and 1/2″-20×3/4″.

90285A124 ..... $406.79

Miniature Thread—*144 Inserts and 144 Screw-Lock Inserts (12 each per size).* Sizes: 1-64×0.110″, 2-56×0.129″, 3-48×0.148″, 4-40×0.168″, 6-32×0.207″, and 8-32×0.246″.

90285A134 ..... $467.61

Metric Thread—*48 Inserts.* Sizes: M5×0.8 in 7.5 mm lg., M6×1 in 9 mm lg., M8×1.25 in 12 mm lg., and M10×1.5 in 15 mm lg.

90285A131 ..... $223.93

Spark Plug Repair Kits

Repair spark plug ports with this kit, which includes inserts, piloted reamer tap, installation tool, and instructions. Furnished in a molded plastic case unless otherwise noted.

30-Pc. M14×1.25 mm Helical Insert Assort.— Has 30 inserts, six each of 3/8″, 7/16″, 0.472″, 1/2″, and 3/4″ lengths.
91732A091 ..... $166.89

24-Pc. M18×1.5 mm Helical Insert Assort.— 24 inserts, 1/2″ long.
91732A055 ..... $186.12

3-Pc. M14×1.25 mm Solid-Style Insert Assort.— Has three inserts (one short reach, one normal reach, and one long reach). Use to repair gasket-seat and taper-seat spark plug ports. Does not include a case.
91732A095 ..... $50.99

18-Pc. M14×1.25 mm Solid Style Insert Assort.— Has 18 inserts (six short reach, six normal reach, and six long reach). Use to repair gasket-seat and taper-seat spark plug ports.
91732A097 ..... $75.03

Tangless Helical & Key-Locking Inserts

18-8 Stainless Steel Tangless Helical Inserts

INSERT DRIVING NOTCH

Installation Tool

Inserts have no tangs to break off, retrieve, or lose. Designed to replace tanged helical inserts (see pages 3282-3284), they have driving notches on each side to improve alignment and a bidirectional design so you don't have to worry about installing them upside down. Rockwell hardness is C43-C50; tensile strength is approximately 200,000 psi. Inserts meet National Aerospace Standard (NAS) 1130.

Standard inserts provide a smooth, free-running thread. ***Screw-lock inserts*** put a self-locking pressure on the bolt, so you don't need other threadlocking devices. They're impact and vibration resistant and are dyed red for easy identification. ***Insert taps*** are plug style and made of high-speed steel.

You will need special ***installation and removal tools*** (sold separately). Both tools have a hollow handle with a plastic cap for storing replacement tips. *Replacement tips* come with one installation or removal tip, two pins, and two springs, unless noted. **To Order:** Please specify internal thread size.

● Tip for 10-32 internal thread size does not come with pins or springs.

Key-Locking Threaded Inserts

Insert

Installation Tool

Quickly and permanently repair stripped threads in stainless steel, aluminum, magnesium, and other metals. To install, screw in the insert until it is slightly below the surface, then hammer its locking keys into the material using the installation tools sold separately.

Inserts with 1/4″ internal thread size and smaller have two locking keys; 5/16″ and larger sizes have four locking keys. Inserts have a thread class of 2A for external threads and 2B for internal threads. Choose from 18-8 stainless steel and C1215 black-phosphate steel.

Thick-wall inserts, also known as heavy duty inserts, are the most common key-locking inserts.
Extra-thick-wall inserts, also known as extra heavy duty inserts, are 1/16″ to 1/8″ thicker than thick-wall inserts.
Thin-wall inserts, also known as lightweight inserts, are 1/16″ to 1/8″ thinner than thick-wall inserts.
Repair kits include inserts, an installation tool, and instructions.

Metric Key-Locking Threaded Inserts

Insert

Installation Tool

Ideal for quick, permanent repair for stripped threads in stainless steel, aluminum, magnesium, and other metals. To install, screw in the insert until it is slightly below the surface; then hammer its locking keys into the material using the installation tools sold separately. Inserts with internal thread sizes up to M6 have two locking keys; larger sizes have four locking keys.

Inserts are thread class 6g for external threads and 6H for internal threads except metric/inch, which are 2A for external threads and 6H for internal threads. Choose from 18-8 stainless steel and C1215 black-phosphate steel.

Metric/metric inserts are only offered in a standard configuration with no thick/thin designation. ***Metric/inch inserts*** let you use inch drills and taps to establish metric internal threads.

Repair kits include inserts, an installation tool, and instructions.

Threaded Inserts with Locking Element

Zinc-Plated Steel

A nylon locking element on the external threads secures these inserts in place so they won't back out or loosen from vibration. Use them to repair damaged, load-bearing threads in magnesium, aluminum, cast iron, copper, masonite, and plastics. To install, drill and tap hole. Then, turn insert into place with a bolt and nut. Thread class is 2A for exterior and 2B for interior. ***Zinc-plated steel inserts*** are made from C12L14 steel.

Self-Locking Threaded Inserts for Metals

Also known as E-Z Lok inserts, these threaded inserts don't require special tools for installation—plus, they have Loctite® adhesive on their external threads to keep them in place.

Install inserts in a tapped hole using a screwdriver or a wrench, bolt, and locknut. To save time during high-volume installations, use a plain steel power driver tool (94110A sold separately). Once inserts are installed, the adhesive on their external threads begins to harden, and within minutes the inserts are ready to accept fasteners. The adhesive bonds to virtually all metals and reaches full strength after 72 hours. Then, the inserts won't back out or vibrate loose. Once it has reached full strength, the adhesive can withstand liquids and gases at pressures up to 6,000 psi.

Inch thread class is 2A external and 2B internal.

Metric thread class is 6g external and 6H internal.

Inch/metric inserts let you use metric drills and taps plus a power driver to establish inch internal threads.

Metric/inch inserts let you use inch drills and taps plus a power driver to establish metric internal threads.

Thick-wall inserts are the most common inserts used to repair and reinforce threads that are prone to stripping. *Spark plug inserts* can be threaded onto a spark plug and manually installed in a tapped hole.

Extra-thick-wall inserts work well in oversized and worn holes.

Thin-wall inserts have smaller external threads than thick-wall inserts, so they require a smaller drilled hole.

Black-Phosphate Steel— The strength of 12L14 steel combined with a black-phosphate coating for mild rust resistance and some lubricity. Rockwell hardness is B68. Minimum tensile strength is 30,000 psi.

18-8 Stain. Steel— Has excellent corrosion resistance. May be mildly magnetic. Rockwell hardness is B92. Min. tensile strength is 30,000 psi.

Type 316 Stainless Steel— Has better corrosion resistance than 18-8 steel because it contains molybdenum, which increases resistance to chlorides and sulfates. May be mildly magnetic. Rockwell hardness is B92. Minimum tensile strength is 30,000 psi.

Repair Kits

Kits include an assortment of thick-wall inserts that repair damaged threads. Choose kits for inch, metric, or metric/inch threads. Steel inserts have a black-phosphate finish. Sizes listed are internal thread size. For external thread/tap sizes, see individual insert listings. Furnished in a plastic case.

Inch Coarse Thread—*22 Inserts.* Sizes: six each 1/2″-13; seven each 5/8″-11 and 3/4″-10; two each 1″-8.
Steel ..... 90248A111 **Kit** $59.40

Inch Coarse Thread—*46 Inserts.* Sizes: 10 each 10-24, 1/4″-20, 5/16″-18, and 3/8″-16; and six each 1/2″-13.
Steel ..... 90248A112 **Kit** $52.00
18-8 Stainless Steel ..... 90247A031 **Kit** $192.61

Inch Fine Thread—*22 Inserts.* Sizes: six each 1/2″-20; seven each 5/8″-18 and 3/4″-16; and two each 1″-14.
Steel ..... 90248A115 **Kit** $59.40

Inch Fine Thread—*46 Inserts.* Sizes: 10 each 10-32, 1/4″-28, 5/16″-24, and 3/8″-24; and six each 1/2″-20.
Steel ..... 90248A114 **Kit** $52.00
18-8 Stainless Steel ..... 90247A032 **Kit** $192.61

Metric—*33 Inserts.* Sizes: 10 each M8×1.25 and M10×1.5; eight each M12×1.75; and five each M16×2.0.
Steel ..... 97084A290 **Kit** $86.43
18-8 Stainless Steel ..... 97120A035 **Kit** $149.56

Metric—*50 Inserts.* Sizes: 10 each M3×0.5, M4×0.7, M5×0.8, M6×1.0, and M8×1.25.
Steel ..... 97084A280 **Kit** $77.00
18-8 Stainless Steel ..... 97120A034 **Kit** $149.56

Metric/Inch—*36 Inserts.* Sizes: 10 each M6×1.0, M8×1.25, and M10×1.5; and six each M12×1.75.
Steel ..... 97084A210 **Kit** $52.00
18-8 Stainless Steel ..... 97120A033 **Kit** $133.69

Self-Tapping Inserts for Metal and Plastics

Insert

Drive Tool

Designed to cut their own threads, these zinc-plated steel inserts are for use in soft metals, plastics, and tough-to-tap materials. Install in a drilled hole using the plain steel drive tool (sold separately); the inserts lock into the base material. The drive tools can also be placed in a chuck on a drill press; turn the chuck by hand to install the insert (do not use power). Or, use drive tools in conjunction with a ratchet wrench or bit brace. Class 2B internal thread fit. Not rated for Rockwell hardness. Minimum tensile strength is 80,000 psi.

Thread Size Internal	External	Insert Lg.	Drill Size	Inserts Pkg. Qty.		Pkg.	Drive Tools Square Size		Each

Self-Tapping Inserts for Wood and Plastics

Insert

Drive Tool

These Alloy 360 brass inserts have widely spaced external threads for a strong hold in wood, soft metals, and weak or brittle plastics. Three external flutes retain chips while cutting to keep the inside threads clean. Install in a drilled hole using the alloy steel drive tool (sold separately). Inserts resist rust and mild atmospheric corrosion. Nonmagnetic. Class 2B thread fit. Not rated for Rockwell hardness. Min. tensile strength is 7,800 psi.

12-Point Insert Nuts for Metals and Plastics

Also known as Allen nuts, these multipurpose insert nuts deliver compact holding power. They have a knurled surface so you can tighten them by hand until a wrench is needed, plus they have a 12-point (double hex) socket for easier hex key engagement. Class 2B thread fit. Use these nuts like inserts to replace stripped and worn threads. Press or draw them into any nonhardened steel, cast iron, or softer nonferrous metal for a strong thread with extra load-carrying capacity. You can even mold them into plastics, ceramics, fiber, and similar materials. Great for use with socket-head screws, hex-head screws, and studs.

18-8 stainless steel has excellent corrosion resistance. May be mildly magnetic. Not rated for Rockwell hardness or tensile strength. ***Alloy steel*** meets load requirements of ASTM A194 for 2H nuts. Rockwell hardness is C33-C39. Not rated for tensile strength.

Threaded Inserts for Thermoplastics

Specially designed for heat installation in thermoplastics and structural foam, these tapered brass inserts provide superior strength. To install, thread an installation tip into the soldering iron (sold separately) and tighten with a set screw. The tip transfers heat from the soldering iron to the insert, melting the surrounding plastic so that it flows into the insert's diagonal knurls and undercuts. When the plastic resolidifies, you get a molded-in insert with excellent torque and pull-out resistance. To extract, thread an extraction tip into the soldering iron. When the plastic melts, pull out the insert. Soldering iron, installation tips, and extraction tips are sold separately.

Inserts are made of Alloy 360 brass to resist rust and mild atmospheric corrosion. They're nonmagnetic with good electrical conductivity. Internal thread class is 2B for inch threads and 6H for metric threads. Not rated for Rockwell hardness, except for inch inserts with a 3/8″ internal thread size, which have a Rockwell hardness of B60-B80. Minimum tensile strength for all inserts is 57,000 psi. **Also Available:** Extraction tips. Please ask for 92160A100 and specify internal thread size.

Soldering Iron

Soldering iron has a chisel-style tip and a temperature of 900°F. Use it with the installation and extraction tips sold separately above. Operates on 120 VAC, 60 Hz, 40 watts and has a 6-ft. cord with two-prong plug.

7662A696 ..... **Each** $23.18

Knock-In Threaded Inserts for Wood and Plastics

Hammer these inserts into a drilled hole in soft materials. You can also mold or sonic weld them into plastic parts. A knurled exterior keeps the inserts in place, and the open-end flange keeps the inserts flush with the surface. Made of low-strength plain 12L13 steel. Class 2B thread fit. Not rated for Rockwell hardness or tensile strength. Length is measured from under the flange.

Internal Thread Size	Lg.	Flange Thick.	Drill Size	Pkg. Qty.		Pkg.

Press-Fit Threaded Inserts for Metals

Installation is easy—just press these inserts into a drilled hole and use an arbor press to permanently secure them. For use in aluminum and other soft metals. Inserts are tapered and self-aligning. Made of zinc-plated 12L14 steel. Class 2B thread fit. Not rated for Rockwell hardness. Minimum tensile strength is 70,000 psi.

Brass Expansion Inserts for Plastics

When the installation tool depresses the spreader plate inside these inserts, a knurled section expands to permanently anchor them in place. For use in straight, blind-hole applications. You can mount inserts flush or let them protrude above the surface. Either way, they provide strong, long-lasting brass threads in thermoplastics.

Made of Alloy 360 brass to resist rust and mild atmospheric corrosion. Nonmagnetic with good strength, durability, and electrical conductivity. Class 2B internal thread fit. Rockwell hardness is B60-B80. Minimum tensile strength is 57,000 psi.

Installation tools (required) quickly and easily install the expansion inserts. Use with a hammer, an arbor press, or a foot press.

Hex Press-Fit Inserts for Plastics

Press-fit inserts make installation in plastics easy—no heat or ultrasonics required. Drill a hole and press insert into place using an arbor press to create strong, reusable threads. The body is hex shaped and won't twist in the hole, so you get extra strength and pull-out resistance. Internal thread fit is Class 2B for inch sizes and 6H for metric sizes. Not rated for Rockwell hardness or tensile strength.

7075-T6 Aluminum—Has one-third the weight of steel. Material is nonmagnetic.

18-8 Stainless Steel—Offers excellent corrosion resistance. May be mildly magnetic.

Brass Press-Fit Inserts for Wood and Plastics

Two-Fin Style

Also called finsert, these inserts have sharp exterior fins that become embedded into the wall of a drilled hole, providing gripping power in wood, composite sheets, and plastics. Fins offer higher holding strength in softer materials. To install, place insert in a drilled hole and hammer or press in place with an arbor press. Minimum material thickness is 1/4″ for one-fin inserts, 7/16″ for two-fin inserts, and 5/8″ for three-fin inserts.

Made of Alloy 360 brass to resist rust and mild atmospheric corrosion. Nonmagnetic with good strength, durability, and electrical conductivity. Class 2B internal thread fit. Rockwell hardness is B78. Minimum tensile strength is 18,000 psi.

Press-Fit Inserts for Plastics

Knurled press inserts are designed to replace molded-in inserts in plastic. Just press into a drilled hole (a precise hole depth is not required). Installing a screw causes the knurls to dig into the plastic to lock in place. No special tool needed. Internal thread fit is Class 2B for inch sizes and 6H for metric sizes.

18-8 Stainless Steel—Offers excellent corrosion resistance. May be mildly magnetic. Rockwell hardness is B92. Minimum tensile strength is 30,000 psi.

Brass—This Alloy 360 brass resists rust and mild atmospheric corrosion. Nonmagnetic with good strength, durability, and electrical conductivity. Rockwell hardness is B78. Min. tensile strength is 18,000 psi.

Inserts ***without flange*** can be installed flush with or below the surface. Inserts ***with flange*** offer a large bearing surface and have a large area for electrical contact. Length includes flange. Flange thickness is 0.020″ for 2-56 to 8-32 sizes; 0.031″ for 10-32 to 3/8″-16 sizes.

Closed-End Cap Inserts for Wood and Plastics

With a low-profile flange and a closed end, these inserts are perfect for exposed applications in wood and plastics. To install, just place insert in a drilled hole and hammer in place. Inserts can also be molded into plastic parts. Made of die cast zinc for good rust and weather resistance. Class 2B internal thread fit. Not rated for Rockwell hardness or tensile strength. Length is measured from under the flange.

Zinc Alloy Inserts with Screw Holes

The flange on these inserts has countersunk holes to accept No. 6 screws—perfect for attaching glides and levelers to wood and particleboard. Ribbed barrel prevents the fastener from turning when tightened and aids fastener retention. Made of die cast zinc alloy for excellent rust resistance. Class 2B internal thread fit. Not rated for Rockwell hardness or tensile strength. Length is measured from under the flange.

Internal Thread Size	Lg.	Barrel Dia.	Flange Thick.	Drill Size	Pkg. Qty.		Pkg.

Knife-Thread Inserts for Wood

Knife threads are self-tapping and provide superior holding power in hard and soft woods and particleboard. Inch internal thread fit is Class 2B; metric is Class 6H. Power drivers have a 1/4″ hex shank, unless noted.

Slotted-drive inserts are ideal for high-volume installations—all you need is a screwdriver. For even faster installation, use our slotted plain steel power drivers (sold separately). *Brass* resists rust and mild atmospheric corrosion. Nonmagnetic. Rockwell hardness is B78. Min. tensile strength is 18,000 psi. *18-8 stainless steel* offers excellent corrosion resistance. May be mildly magnetic. Rockwell hardness is B92. Min. tensile strength is 30,000 psi.

High-strength hex drive inserts are made of high-strength plain steel so you can use them in harder materials. To install, drill a hole and screw in insert with a hex drive. Not rated for hardness or tensile strength.

Hex-drive inserts have a tapered body (except 92105A779, which has a straight body). Made of zinc alloy for good rust resistance. To install, drill a hole and screw in insert with a hex drive. Not rated for hardness or tensile strength. Inserts *without flange* are set beneath the surface; inserts *with flange* let you control insertion depth. Flange thickness is 0.01″-0.02″. For faster installation, use our hex drive plain steel power drivers (sold separately).

Nylon Screw Receptacle Inserts

For solid screw attachment in thin panels from 1/32″ to 5/32″ thick. These receptacle inserts snap into a square hole. When a screw is driven in, they become tight against the panel. Inserts withstand temperatures up to 167°F. Color is off-white. Not rated for hardness. Min. tensile strength is 12,000 psi. Package quantity is 50, unless noted.

Tee Nuts

Here's an easy way to put steel threads in wood, plastic, and particleboard. Just drill a hole to fit the barrel, insert tee nut, and hammer in the prongs until the base of the tee nut is flush with the surface. Inch internal thread fit is Class 2B. Metric internal thread fit is Class 6H. Not rated for Rockwell hardness or tensile strength. Nuts with fewer prongs minimize splitting in hard materials.

Zinc-plated steel offers good rust resistance. *18-8 stainless steel* offers excellent corrosion resistance. May be mildly magnetic. *Plain steel* is low-strength C1006-C1008 steel.

18-8 Stainless Steel Pillar Posts

Combine posts, spacers, and bases to build structures of varying heights. ***Posts*** are solid stainless steel with a 1/4″-20 threaded hole on each end and a through hole for a tightening rod. Stack posts on a threaded rod (sold separately) to increase height or use ***spacers*** to make smaller adjustments. Spacers have a center clearance hole that allows a 1/4″ dia. stud to pass through to components on either side. Add a ***base*** to give your pillar post a wide, stable foundation. It has a 1/4″-20×5/16″ long male stud that threads into the posts.

18-8 Stainless Steel Mounting Posts

Construct assemblies with flexibility and precision. Often used for cage assemblies, ***male×male*** posts come with a 4-40 stud on each end and ***female×male*** posts come with a 1/4″-20 threaded hole on one end, a 8-32 male stud on the other, and a through hole for a tightening rod. Posts are solid and have a length tolerance of ±0.005″.

Tee Nuts without Prongs

Great for hard plastic, wood, and other nonmetallic materials that prong-style tee nuts might split. Also known as propel nuts, these tee nuts are popular for use with glides and levelers in blind and end-grain applications. To install, place nuts in a drilled hole and hammer into place. Made of plain, low-strength C1006-C1008 steel. Class 2B internal thread fit. Not rated for Rockwell hardness or tensile strength.

Knurled Rivet Nuts

Ideal for materials that are too thin to tap, these knurled nuts will expand when installed, providing extra strength and increased resistance against spin and pullout.

To install, first determine material thickness. Next, thread nut onto mandrel of an installation tool (see pages 3297-3298 for installation tools), place in drilled hole of material, and crimp to create a backside flange. A secure permanent fit between the top flange and the crimped bottom section (see illustration) is formed. Once in place, the internal threads are ready for a screw or bolt (sold separately).

18-8 stainless steel nuts have excellent corrosion resistance. Aluminum nuts are made of 5056 aluminum and are ideal for outdoor use. Zinc yellow chromate-plated steel nuts are made of C1008-C1010 steel and have good rust resistance. *Inch* sizes have Class 2B thread fit. *Metric* sizes have Class 6H thread fit.

Open End— Nut is open at bottom, allowing the use of a longer screw or bolt if desired.

Closed End— Thread area is enclosed, which prevents leakage past the threads from either side of your application.

Self-Sealing— Nuts have a PVC foam seal bonded under the flange.

Kits— All nuts are zinc yellow chromate-plated steel.

50-Piece Open-End Inch Kit— Includes 12 each 8-32, 10-24, and 10-32 nuts, and 14 each 1/4″-20 nuts. Overall material thickness range is 0.020″ to 0.260″. Also includes three nosepieces, four mandrels, and a plier-style installation tool. Furnished in a plastic case.

95105A400 ..... **Each** $95.70

50-Piece Open-End Metric Kit— Includes 12 each 4 mm nuts, 24 each 5 mm nuts, and 14 each 6 mm nuts. Overall material thickness range is 0.5 mm to 6.6 mm. Also includes two nosepieces, three mandrels, and a plier-style installation tool. Furnished in a plastic case.

95105A500 ..... **Each** $104.44

Standard Rivet Nuts

Before Installation

After Installation

Similar to open-end knurled rivet nuts, standard rivet nuts provide a thicker flange profile to resist push-through. To install, first determine the material thickness, then thread nut onto mandrel of installation tool (see pages 3297-3298 for installation tools), place in drilled hole, and crimp to create a backside flange. A secure fit between the top flange and the crimped bottom section (see illustration) is formed. Once in place, the internal threads are ready for a screw or bolt (sold separately). Threads meet Class 2B. ***Aluminum*** (5154/6061) nuts weigh one-third as much as steel and offer mild corrosion resistance. ***Zinc-plated steel*** nuts are made of C1006-C1010 steel and have excellent corrosion resistance.

103-Piece Inch Kit—Includes 25 aluminum 6-32 nuts, 25 steel 8-32 nuts, 25 steel 10-24 nuts, 20 aluminum 1/4″-20 nuts, and 8 steel 1/4″-20 nuts. Overall material thickness range is 0.010″ to 0.165″. Also includes three nosepieces, four mandrels, and a plier-style installation tool. Furnished in a 13 1/2″ Lg.×7 1/4″ Wd.×2″ Dp. plastic case.
95585A300 ..... **Each** $94.22

200-Piece Kits—Each includes 200 nuts, two nosepieces with mandrels, and a plier-style installation tool. Furnished in a 12 1/2″ Lg.×8 1/2″ Wd.×1 7/8″ Dp. plastic case. *Inch kit* includes 80 each 8-32 nuts and 120 each 10-32 nuts. Overall material thickness range is 0.010″ to 0.180″. *Metric kits* include 120 each M4 nuts and 80 each M5 nuts. Overall material thickness range is 0.25 to 5 mm.

Inch Kit—Aluminum	92387A690	**Each**	$168.81
Metric Kit—Aluminum	92387A810	**Each**	$172.48
Metric Kit—Zinc-Plated Steel	92387A850	**Each**	$184.23

Slotted-Body Rivet Nuts for Thin Materials

A larger backside flange increases strength, making these slotted-body nuts ideal for use in plastic and thin materials. They can accommodate a wider range of material thicknesses as well as slightly oversized holes. To install, first determine the material thickness, then thread nut onto the mandrel of an installation tool (see 96349A on page 3297 or 92894A on page 3298), place in drilled hole, and crimp. Made of C1008-C1010 zinc yellow chromate steel. Threads meet Class 2B.

Screwdriver-Installed Rivet Nuts for Thin Materials

Also known as jack nuts, these steel rivet nuts are ideal for use in thin, soft, and brittle materials and can be easily installed with a screwdriver—no special tools needed. When tightened, the body collapses to form legs, which grip the inside of the mounting surface. *Zinc-plated* nuts are rust resistant. *Self-sealing coated* nuts seal out moisture to prevent corrosion. *PVC-coated* nuts protect from scratches and corrosion.

Friction-wrench tool (included) installs a limited number of jack nuts. To use, press tool against head of jack nut and run in screw (not included) to set. ***Jack-nut tool*** allows quicker and easier installation. To use, thread pull rod (required; sold separately) into jack nut, insert into hole, and squeeze handles to set.

Screwdriver-Installed Rubber-Insulated Rivet Nuts

Also known as well nuts and well-nut threaded inserts, these flanged neoprene bushings have a brass insert and are great for fastening metal to plastic, damping vibration, and sealing out moisture. They can be installed easily with a screwdriver—no special tools needed. To use, place bushing in a hole and insert a machine screw (not included). Tightening the screw causes the bushing to expand, securing the nut.

115-Piece Kit—Includes 40 8-32 nuts, 40 10-32 nuts, and 35 1/4″-20 nuts. Overall material thickness range is 0.015″ to 0.643″.

Rivet Nut Inserts

Inserts can be installed into most any material that is 0.030″ or thicker. As the insert is installed, the threaded portion is drawn into the sleeve, creating pressure against the hole and securing the insert. Drill size listed in table is for material with a 0.030″-0.090″ thickness. Thicker material may require larger holes. The inch flange (D) is 0.015″ thick; metric flange (D) is 0.38 mm thick. Inserts are for use with Grade 8 (Class 2B thread fit) and metric Class 12.9 screws (Class 6H thread fit). ***Cadmium-plated inserts*** offer excellent resistance to rust. *Steel* is C1010-C1110. Weather-resistant *aluminum* is 6061-T6. ***Tin-plated 18-8 stainless steel inserts*** resist food acids and offer excellent corrosion resistance. ***Insert kits*** include a nut insert tool, mandrels, and inserts. Kits in sizes 8-32, 10-32, and ¼″-20 have 100 inserts; all others have 50. Furnished in a 10″ Lg.×7″ Wd.×2″ Dp. plastic case.

Insert Combination Kits

All inserts are cadmium-plated steel. All kits contain a nut insert tool and are furnished in a 13½″ Lg.×10″ Wd.×2″ Dp. plastic case.

300-Piece Inch Kit— Contains 50 each of sizes 4-40, 6-32, 8-32, 10-32, ¼″-20, and 5/16″-18; and six mandrels.
98560A131 ..... $239.98

225-Piece Metric Kit— Contains 50 each of sizes M3, M4, M5, and M6, and 25 each of size M8; and five mandrels.
91230A600 ..... $222.28

Accessories

Nut Insert Tool— To use, thread a nut insert onto the mandrel of the same size (sold separately) and place it into hole. Then push down on the T-handle and turn clockwise to install. Tool is all metal; handle is aluminum.
98590A100 ..... $62.50

Mandrels— No special tools are needed to change mandrels.

Wrench-Drive Rivet Nut Installation Tools

Easily install knurled and standard rivet nuts as well as rivet nut inserts with these manual installation tools. Each includes two mandrels per thread size. Use with steel, aluminum, and stainless steel rivet nuts and nut inserts. Use a 7/8″ wrench (not included) to hold the tool and a 11/16″ ratchet (not included) to tighten the nut.

Rivet-Type Studs

These unique threaded studs are an ideal alternative to weld-and-clinch studs. To install, thread stud into the nosepiece of the installation tool (see 92388A on page 3298). Insert body into hole. The installation tool continues to install the studs, forming a backside flange that resists pullout. *Note:* Dimension (F) is based on maximum installation thickness.

Studs are made of C1038 steel with a zinc-plated finish for excellent resistance to rust. Threads meet Class 2A. Bodies are made of C1008-C1010 steel. Use with Grade 5 nuts.

(3) Adjustable-Stroke Tools

A stroke indicator ensures proper installation. Tools install a wide range of sizes and set aluminum and steel rivet nuts and steel rivet-type studs (unless noted). *Regular tool* has a spin-to-reverse knob for quick removal. Weighs 3.5 lbs. *Heavy duty tool* has a quick-acting, pull-to-remove plunger. Does not set rivet-type studs. Weighs 5 lbs. Mandrel and nosepiece sets (required; sold separately) are interchangeable between both tools (unless noted).

♦ Does not work on regular tool; for use with heavy duty tool only.
★ Only sets aluminum rivet nuts.

Power-Driven Rivet Nut Installation Tools

A simple "spin-pull-spin" sequence quickly and efficiently installs all styles of aluminum and steel rivet nuts (unless noted). To use, thread insert onto mandrel and depress trigger to "spin" the insert onto the tool. Place insert into application and depress ("pull") trigger; tool will automatically set insert. Press trigger to reverse ("spin") the mandrel off.

Cordless Rechargeable 14.4-Volt Tool

Battery pack fully charges in one hour; tool will set 180 to 600 rivet nuts per charge (depending on size and material). Tool provides 2,800 lbs. of pulling power with an adjustable stroke up to 0.216″ and includes mandrels and nosepieces for setting 8-32, 10-32, and 1/4″-20 rivet nuts (additional sizes sold separately); battery pack; charger; and 14″ Lg.×11″ Wd.×3 3/4″ Dp. steel carrying case. Weighs 4.8 lbs.

★ Only sets aluminum rivet nuts.

Air-Powered Tools

Ideal for use in a range of material thicknesses, this tool has a quick-change nosepiece for head assembly replacement without tools. Only sets thin wall aluminum and steel rivet nuts. Operating pressure is 35-120 psi. Connection is 1/4″ NPT. Weighs 4 lbs.

Also Available: Replacement head assembly kit. Includes hex drive, mandrel, bearing set, and nose cone. Can be replaced without tools. Please ask for 94675A660 and specify thread size.

Also Available: Replacement mandrel. Ask for 94675A550 and specify thread size.

Blind-Rivet Style

Fasten a snap to a solid surface when you only have access to one side. The snap is nickel-plated brass; the mandrel is 18-8 stainless steel. Requires a 1/8″ diameter drilled hole and a blind rivet tool for installation.

For Material Thickness	Pkg. Qty.	Pkg.
1/8″ to 3/16″	25	95707A688 $8.74
3/16″ to 3/8″	25	95707A687 9.91

Fabric Snap and Tool Kits

Repair tarps, tents, and awnings with one convenient kit. Each kit includes a hand punch tool with a die, and six complete 9/16″ diameter nickel-plated brass snaps.

The fabric-to-wood kit has #7 × 5/8″ tapping screw studs to attach fabric to wood or similar materials.

Replacement snaps include six complete snaps.

	Snap and Tool Kits		Replacement Snaps	
Fabric-to-Fabric	95730A210	$7.03	95730A320	$4.36
Fabric-to-Wood	95730A230	8.68	95730A440	6.12

Installation Tools for Fabric Snaps

All the tools you need to swiftly install 9/16″ dia. fabric snaps.

Hand Press and Dies

Squeeze the adjustable pliers-grip handle to easily install snaps. Made of aluminum. Comes with a 4-piece die set to install male and female snap halves. *Note:* Also installs grommets (see pages 3774-3775 for grommets and dies).

Hand Press	95720A690	$139.54
Die for Stacker Snaps	95720A350	45.51
Replacement 4-Pc. Die Set	95720A692	91.50

Hand Punch and Dies

Strike the punch with a mallet to set snaps. Made of stainless steel. Dies are sold separately.

Hand Punch	95710A690	$14.09
Die for Female Snap Halves	95710A696	10.97
Die for Male Snap Halves	95710A698	10.97

Bench-Mount Press and Dies

Install snaps with one easy push. Made of iron, it has a deep throat and a long padded handle. Dies are sold separately. The *4-piece die set* installs male and female snap halves.

Bench-Mount Press	95715A690	$264.24
4-Pc. Die Set	95715A692	210.19
Die for Stacker Snaps	95715A360	72.93

Locking Hammer-Set Fabric Snaps

Also known as slam rivets. Use a hammer to lock these two-piece snaps together. Snaps must be destroyed to be removed.

Cap Dia.	Max. Material Thickness	Pkg. Qty.	Pkg.
Nickel-Plated Brass			
9/32″	1/4″	50	97362A100 $8.60
Nickel-Plated Steel			
3/8″	1/4″	100	97362A300 7.22
1/2″	3/16″	50	97362A500 8.48

Turn-Button Fasteners

Attach leather, canvas, and other fabrics to solid surfaces such as wood and fiberglass. Fasteners are made from nickel-plated brass.

To install, cut the fabric using the *cutting punch* (sold separately). Push the *eyelet* prongs through the fabric and crimp the prongs over the *washer* on the opposite side. Install the *stud base* with screws or screw in the *screw stud* with the required *hand driver* (sold separately).

Eyelet is 1 1/16″ Lg. × 13/16″ Wd. Stud base has two holes for #6 screws (not included). Screw stud size is #7 × 5/8″.

Eyelets and Washers (5 pairs)	95678A678	Pkg.	$2.45
Stud Base (5/Pkg.)	95678A671	Pkg.	5.85
Screw Stud (5/Pkg.)	95678A674	Pkg.	12.44
Cutting Punch	95678A690	Each	55.64
Hand Driver for Screw Stud	95678A695	Each	17.95

About Blind Rivets

Blind rivets join materials together when you don't have access to both sides. They consist of a *rivet* (a hollow body with a head) and a *mandrel* (a thin nail with a bulbed end). Rivets require a setting tool for installation (see pages 3305-3307).

To hold rivets in large holes and soft materials use Blind Rivet Washers (see 90183A on page 3229).

To select the proper rivet there are several factors to consider:

Material Thickness— Make sure the combined thickness of the materials you are joining falls within the rivet's material thickness range.

Diameter— The diameter of the rivet body determines the hole size.

Material— To maximize strength and minimize corrosion, use rivets made of the same material as the components you are fastening. When an exact match isn't possible, choose rivets that are painted or coated.

Shear and Tensile Strengths— To ensure rivets have the strength you need, consider *shear strength* (the amount of force it takes to break a rivet from the side) and *tensile strength* (the amount of pull a rivet can withstand without breaking). *Note:* Joint strength is also affected by the space between the rivets, their distance from the edge of the work, and hole size.

Head Style— *Domed* rivets are suitable for most applications. They have a low profile and a neat appearance. *Wide-domed* rivets have a large head diameter that provides extra holding strength for soft, thin materials or oversized holes. *Countersunk* rivets have an angled head that sits flush when installed.

How to Install a Blind Rivet

Insert the rivet through a hole that passes through the materials being joined. Using a rivet tool with the same size nosepiece as the rivet diameter, grip the mandrel and pull the trigger or lever. The tool pulls the mandrel through the rivet, deforming the rivet's body and breaking off the excess mandrel.

Blind Rivets

Also known as Pop and open-end rivets, these blind rivets meet IFI 114 (Industrial Fasteners Institute) standards, unless noted.

18-8 stainless steel rivets and mandrels have excellent corrosion resistance and may be mildly magnetic.

Aluminum rivets and mandrels are corrosion resistant and nonmagnetic.

Zinc-plated steel rivets with steel mandrels have good rust resistance.

Aluminum rivets with steel mandrels meet military specification MIL-R-24243/1E wherever a dash number is shown. They are corrosion resistant and nonmagnetic.

Corrosion-Resistant Blind Rivets

Rivets are ideal for marine and other outdoor applications.

Type 316 stainless steel rivets and mandrels have better corrosion resistance than 18-8 stainless steel. May be mildly magnetic.

Copper and ***nickel-copper*** rivets are corrosion resistant and nonmagnetic. They have steel mandrels. Rivets meet IFI 114 (Industrial Fasteners Institute) standards.

Choose-a-Color Blind Rivets

Select a color that makes your rivets stand out or blend in. Rivets and mandrels are aluminum, which is corrosion resistant and nonmagnetic. They meet IFI 114 (Industrial Fasteners Institute) standards.

To Order: Please specify color: black, blue, dark brown, gray, red, white, or yellow.

Plastic Blind Rivets and Tools

Fasten plastics to wood, metal, fiberglass, acrylics, and other synthetics. All rivets are nylon; choose from off-white rivets with nylon mandrels and black rivets with acetal mandrels. Acetal is more moisture resistant than nylon. Nylon absorbs moisture which can affect dimensions and other properties. Rivets are electrically non-conductive. Temperature range is –22° to +176° F. Head is domed.

Install with the *plastic blind rivet tool* sold separately below.

♣ Head height (B) is 0.13″.

Plastic Blind Rivet Tool

Installs all sizes of plastic blind rivets. It takes one hand to operate and installs most rivets with a single stroke. Closed height is 1¾″.

97540A210 ..... $51.84

Sealing Blind Rivets

Also known as closed-end sealing rivets, they prevent water and air from passing through or around them. Because most of the mandrel is retained, they have higher shear and tensile strengths than standard blind rivets of the same size and material.

Stainless steel rivets and mandrels have excellent corrosion resistance and may be mildly magnetic. Rivets are 18-8 stainless steel; mandrels are 300 series stainless steel. ***Aluminum*** rivets and mandrels are corrosion resistant and nonmagnetic. ***Aluminum with steel mandrel*** rivets have corrosion resistant and nonmagnetic bodies.

Domed with plastic seal rivets have a sealant bonded underneath the head to reduce leaks. The sealant withstands temperatures of –60° to 250° F. Rivets and mandrels are aluminum, which is corrosion resistant and nonmagnetic.

High-Strength Blind Rivets

Also known as structural rivets, they have higher shear and tensile strengths than standard blind rivets of the same size and material.

Domed—Also known as Q-rivets, they're resistant to vibration.

Domed for Wide Thickness Ranges—Also known as ultra-grip rivets, they can handle a wide range of thicknesses.

18-8 stainless steel rivets and mandrels have excellent corrosion resistance and may be mildly magnetic. ***Zinc-plated steel*** rivets and mandrels have good corrosion resistance. ***Aluminum*** rivets and mandrels are corrosion resistant and nonmagnetic.

Blind Rivets for Soft and Brittle Materials

When installed, rivet bodies fan out to provide a uniform grip. They're good for oversized holes. Heads are domed.

Peel Style—Fasten soft materials such as plastic and fiberglass to thin materials such as sheet metal. When installed, the body splits into "petals" that draw materials together without pulling through them. Rivets are aluminum, which is corrosion resistant and nonmagnetic. Mandrels are steel.

Bulb Style—Part of the mandrel is retained, which increases shear strength. They're designed to fasten brittle materials such as plastic and laminates without damaging them. Rivets and mandrels are aluminum, which is corrosion resistant and nonmagnetic.

Wide Thickness Range Blind Rivets

Also called multigrip rivets, the rivet body expands to fill slightly oversized and irregular holes. Each size has up to twice the material thickness range of standard blind rivets. When installed, the mandrel remains in the body which reduces vibration and forms a moisture-resistant seal. Rivets are aluminum, which is corrosion resistant and nonmagnetic. Mandrels are steel.

To Order: For painted rivets, please specify color: black or white.

Tamper-Resistant Two-Piece Rivets

A solid, smooth head makes these rivets difficult to pry or remove. They accommodate extra-wide thicknesses and have a large diameter head on each side to grip soft materials tightly without crushing them. Rivets are aluminum, which is corrosion resistant and nonmagnetic. Mandrels are steel. Not rated for shear strength.

Grooved Blind Rivets for Wood

As it's installed, the rivet body expands and the grooves dig into the wood for a tight hold. Rivets are aluminum, which is corrosion resistant and nonmagnetic. They have steel mandrels. Head is domed. Not rated for shear and tensile strengths.

Blind Rivet Assortment

Includes 585 domed aluminum rivets, which are corrosion resistant and nonmagnetic. Mandrels are steel. Contains 1/8″ and 3/16″ diameter rivets in the following thickness ranges: 0.063″-0.125″, 0.126″-0.187″, 0.126″-0.25″, 0.188″-0.25″, 0.251″-0.375″, and 0.376″-0.5″. Packaged in a compartmented plastic box with lid chart.

97455A300 ..... $58.42

Manual Tools for 3/32″-3/16″ Diameter Blind Rivets

All tools come with four nosepieces, unless noted. Tools install 3/32″, 1/8″, 5/32″, and 3/16″ dia. standard blind rivets that are all aluminum, aluminum with steel mandrels, and all steel. They also install 3/32″, 1/8″, and 5/32″ dia. standard blind rivets in 18-8 stainless steel and Type 316 stainless steel, as well as 1/8″ dia. copper rivets with steel mandrels. They do not install nickel-copper blind rivets.

Heavy Duty Tool

Our most popular manual blind rivet tool.

The *rivet tool kit* includes the tool plus 175 domed rivets (100 1/8″ dia. all-steel, 50 1/8″ dia. all-aluminum, and 25 3/16″ dia. aluminum with steel mandrel) and 25 countersunk rivets (1/8″ dia. all-steel). Includes 0.063″-0.125″ and 0.188″-0.25″ material thickness ranges.

Ratchet-Action Tool with Mandrel Collector

Easiest to use; lets you install rivets with up to 40% less force. It has a mandrel collector that catches spent mandrels and stores nosepieces.

The tool comes with three nosepieces to install 1/8″, 5/32″, and 3/16″ dia. blind rivets. To install 3/32″ dia. blind rivets, order the optional 3/32″ nosepiece (sold separately).

Rivet Tool	97543A120	$75.41

Manual Lever-Handle Tools for 1/8″-1/4″ Diameter Blind Rivets

Long handles give you extra leverage to install rivets in areas where other tools can't reach. For an additional 2½″ of reach, add the optional nose extension (sold separately).

Tool comes with three nosepieces to install 5/32″, 3/16″, and 1/4″ dia. blind rivets in all materials. To install 1/8″ dia. blind rivets, order the optional 1/8″ nosepiece (sold separately).

The *rivet tool with mandrel collector* includes a built-in mandrel receptacle.

Hydraulic Powered Tools for 3/32″-1/4″ Diameter Blind Rivets and Rivet Nuts

This self-contained hydraulic tool lets you install blind rivets and knurled and standard rivet nuts with one hand. (See pages 3295-3296 for rivet nuts.)

Tool comes with five nosepieces to install 3/32″, 1/8″, 5/32″, 3/16″, and 1/4″ dia. blind rivets, plus pull-up studs and anvils to install 10-24 and 1/4″-20 aluminum and steel rivet nuts. Furnished in a plastic case.

Also Available: Pull-up studs and driving anvils for 6-32 to 3/8″-16 and M3 to M10 rivet nuts. Please ask for 6879A555 and specify size.

Air-Powered Tools for Blind Rivets

A Mandrel Collecting

B&C Standard and Long Reach

D Heavy Duty

E Super Heavy Duty

F Vertical

G Low Clearance

H Super Low Clearance

J Economy

(A) Mandrel Collecting Tool— Comes with three nosepieces and a plastic mandrel collection bottle. A vacuum system holds rivets in place during installation. Maximum air pressure is 100 psi. Air hose is 6 ft. long. Hose fitting is 3/8″ NPT female. Overall size is 9″ Ht.×11″ Wd.

(B) Standard Tool and ***(C) Long Reach Tool—*** Come with three nosepieces. A *3/32″ nosepiece* (sold separately) lets you install 3/32″ dia. rivets in all materials. Maximum air pressure is 85 psi. Air hose is 6 ft. long. Hose fitting is 3/8″ NPT female. *Style B* includes an extra pair of jaws, a jaw pusher, and a jaw pusher spring. Overall size is 9 1/2″ Ht.×9 1/2″ Wd. *Style C* has an extra-long nosepiece for hard-to-reach applications. Overall size is 9 1/2″ Ht.×11 1/2″ Wd.

(D) Heavy Duty Tool— Comes with three nosepieces. A *3/32″ nosepiece* (sold separately) lets you install 3/32″ dia. blind rivets. Maximum air pressure is 90 psi. Air hose is 6 ft. long. Hose fitting is 3/8″ NPT female. Overall size is 10 1/2″ Ht.×11 1/2″ Wd.

(E) Super Heavy Duty Tool— Comes with four nosepieces. Maximum air pressure is 90 psi. Air hose is 6 ft. long. Hose fitting is 3/8″ NPT female. Overall size is 12 1/2″ Ht.×12″ Wd. Use the *3/16″* and *1/4″ nosepieces* (sold separately) to set T-rivets and Monobolt rivets (except for stainless steel T-rivets).

(F) Vertical Tool— Can be suspended over a workbench. Comes with four nosepieces. A vacuum system holds rivets in place during installation. Maximum air pressure is 85 psi. Hose fitting is 1/4″ NPT male (air hose not included). Overall size is 16″ Ht.×3″ Wd.

(G) Low Clearance Tool— Comes with four nosepieces and an adjustable mandrel deflector. Maximum air pressure is 85 psi. Hose fitting is 1/4″ NPT male (air hose not included). Overall size is 8″ Ht.×11 1/2″ Wd.

(H) Super Low Clearance Tool— The handle is separate from the body to provide easier reach into tight spaces. Comes with five nosepieces. Maximum air pressure is 92 psi. Air hose is 5 ft. long. Hose fitting is 1/4″ NPT male. Overall size is 5 1/2″ Ht.×9″ Wd.

(J) Economy Tool— Comes with three nosepieces, a plastic mandrel collection bottle, and an extra set of jaws. A vacuum system holds rivets in place during installation. Maximum air pressure is 90 psi. Hose fitting is 1/4″ NPT female (air hose not included). Overall size is 11 1/2″ Ht.×10 1/2″ Wd.

Drill Attachments for 1/8"-1/4" Diameter Blind Rivets

Insert the hex shaft of these attachments into a 3/8" diameter or larger drill chuck and tighten to convert a cordless, electric, or air-powered drill into a blind rivet tool. Operate in forward to set rivets and in reverse to eject mandrels.

Style 1

Style 2

Cordless Tools for 3/32"-3/16" Diameter Blind Rivets

Perfect when there's no power source nearby. Comes with four nosepieces to install 3/32", 1/8", 5/32", and 3/16" blind rivets (except 3/16" dia. all-stainless steel and nickel-copper blind rivets). A 12-volt battery and battery charger are included. Installs up to 210 rivets with a full charge. Pull capacity is 1,900 lbs.; stroke length is 3/4". Nose is 7/8" Dia.×2 3/4" Lg. Overall size is 9" Ht. ×12" Wd. Comes in a plastic case.

High-Strength Bolt-Type Rivets and Air-Powered Installation Tools

Rivets

Bolt and Collar

Collar

Choose these rivets when you need a strong permanent joint that delivers high uniform clamp force and vibration resistance. Also called Magna-Grip lockbolts, they are made of zinc-plated steel. Length is measured from under the head.

A complete rivet consists of a ribbed (not threaded) bolt and a collar (each sold separately). A tool and a nosepiece (sold separately below) are required for installation.

Military Specification Solid Rivets

Made of heat-treated aluminum with a matte gold finish per MIL-C-5541.

Low-profile domed rivets meet MS 20470 and NASM 20470. Head height is approximately 65% of other domed head rivets. Length is measured from under the head.

Countersunk rivets meet MS 20426 and NASM 20426. Head is countersunk 100°. Length is measured from the top of the head.

Domed and Flat Head Solid Rivets

Length is measured from under the head. ***18-8 stainless steel*** rivets have excellent corrosion resistance; may be mildly magnetic. ***Aluminum*** rivets are nonmagnetic and have mild corrosion resistance. ***Brass*** rivets are nonmagnetic with good strength, durability, corrosion resistance, and electrical conductivity. ***Copper*** rivets are electrically conductive and corrosion resistant.

Low-Profile Domed Head Solid Rivets

A lower head height than other solid rivets provides a more finished appearance when installed. Length is measured from under the head.

Domed—*Steel* rivets are also known as truss head rivets. *Aluminum* rivets are also known as universal head rivets. They are nonmagnetic and have mild corrosion resistance.

Wide Domed—Also known as brazier head rivets. All are aluminum and are nonmagnetic and have mild corrosion resistance.

Low-Profile Flat Head Solid Rivets

Use for HVAC ducts and other sheet metal applications. Also known as tinners' rivets. All are made of steel. Length is measured from under the head.

Countersunk Head Solid Rivets

Head is flush when installed. Length is measured from the top of the head.

18-8 stainless steel rivets have a 90° countersunk head. They have excellent corrosion resistance and may be mildly magnetic.

Steel rivets have a 90° countersunk head.

Aluminum rivets have a 78° countersunk head. They offer mild corrosion resistance and are nonmagnetic.

Brass rivets have a 90° countersunk head. They are nonmagnetic with good strength, durability, corrosion resistance, and electrical conductivity.

Wide-Countersunk Head Solid Rivets with Bearing Washer

Heads are countersunk 144° to provide a flush surface when set—just what you need for fastening leather, conveyor belts, and copper-alloy assemblies. Also known as belt rivets. All have a tapered shank and are made of corrosion-resistant copper. An equal quantity of washers is included with the rivets. Length is measured from the top of the head.

Installation Tools for Solid Rivets

Set solid rivets using this tool and your hammer. For proper installation, choose a tool with a setter hole diameter slightly larger than the rivet being set. Use the setter hole and concave recess to draw sheet metal around the rivet, flatten the shank, and form a domed head. Use the outlet hole on the side of the tools to dislodge metal slugs. Made of steel.

Squeeze Tools for Aluminum and Brass Solid Rivets

You'll get 3,500 pounds of pressure to set aluminum or brass solid rivets. Tool head rotates 360°. Maximum rivet length is 5/8″.

Note: Not for use with steel or stainless steel rivets.

Die sets are sold separately and include check nuts.

Air-Powered Squeeze Tools for Aluminum and Steel Solid Rivets

Tools

Also known as alligator squeezers, these tools offer uniform results and quiet operation when setting solid metal rivets. Tools have a throttle to control speed. They have a 1/4″ NPT female swivel air inlet. Maximum air pressure is 90 psi.

93970A330 and 93970A310 have two cylinders for twice the setting force.

Rivets for Soft Materials

Join lightweight materials such as leather, canvas, plastics, wood, fiberboard, and light gauge metals.

Split rivets are also known as truss-head rivets. To install, punch a hole, drive in with a hammer, and split legs. *Nickel-plated steel* rivets have fair rust and weather resistance. *Brass* rivets are corrosion resistant and nonmagnetic.

Semi tubular rivets are also known as brake-lining rivets. Head is countersunk 150°. All are made of brass so they are corrosion resistant. They are also nonmagnetic. Internal hole depth is 1/8″ to 1/4″. A punched hole is required. Use an installation tool (sold separately on this page) for proper installation.

Full tubular rivets are self piercing and have an internal hole that extends nearly the full length of the shaft, which eliminates the need for a punched hole. Internal hole depth is 1/4″ to 1/2″. Head is countersunk 150°. All are made of copper-plated steel that has fair rust and weather resistance. Use the installation tool (sold separately on this page) for proper installation.

Installation Tools for Tubular Rivets

One of these tools and your hammer are all you need to clinch or expand the base of semi tubular and full tubular rivets. Tools are made of steel. Use on aluminum, steel, brass, and copper rivets.

Two-Piece Press-Fit Tubular Rivets

Also known as cutlery rivets. Press the solid male shank into the tubular female piece to fasten wood to metal and metal to metal. Rivets are made of brass.

Vibration-Resistant Panel Screws

Also known as Fab-Lok fasteners, these combination rivet/screws have enough holding power to withstand excessive vibration, expansion, and contraction. After tightening, the sleeve stays in place even if the screw is removed. Use for fastening metal and insulated panels.

Each panel screw consists of a 10-24 machine screw with a hex-washer head, a 1/2″ dia. EPDM sealing washer, and an aluminum sleeve that fans out when installed for added strength. A corrosion-resistant coating provides 100 hours of salt-spray resistance and acts as a lubricant to reduce friction.

Like blind rivets, they install from one side only. Set them in a 5/16″ dia. hole using a 5/16″ closed-end wrench. For faster installation, use a torque adjustable power driver along with the *holding tool and socket* (sold separately).

Easy-to-Install Plastic Rivets

Ribbed Shank

Click-Lock Shank

Expanding Shank

Interlocking Shank

Adjustable Shank

Reusable Arrow Shank

Split Shank

Snap Shank

Reusable Keyhole Shank

No special tools required when you use these rivets to join plastic, composite, metal, wood, foam, and particleboard panels. Also known as push, panel, and tree clips, each rivet fastens a specific material thickness or thickness range. All are made of nylon. Temperature range is –40° to +149°F. *Note:* Nylon absorbs environmental moisture, which can affect dimensions and other properties.

To Order: Please specify color: black or off-white (unless noted).

Ribbed Shank— Shank grips and holds materials for a secure, permanent joint. A removal tool is sold separately below.

Click-Lock Shank— Place in a hole and press the head. When you hear a snap, you know the shaft has expanded and the rivet is secured. Pry to remove.

Expanding Shank— Insert the rivet in a hole and press the pin. This expands the shaft and locks the rivet in place.

Interlocking Shank— Identical parts with internally serrated prongs ratchet together. Two heads provide a finished look on both sides.

Adjustable Shank— Consist of a rivet and a washer. Insert the rivet in the hole and push the washer to the desired length. Clip excess length if needed. Pry apart or cut to remove.

Reusable Arrow Shank— Arrow shape collapses when pushed through a hole then springs back completely to hold fast. Pry to remove.

Split Shank— A rounded, split shank compresses to slide through a hole, then expands to form a strong joint.

Snap Shank— Push the male and female parts together. Two heads provide a finished look on both sides. Pull apart to remove.

Reusable Keyhole Shank— The extra-flexible body slips effortlessly through small holes and takes up slack to provide a tight, reliable joint. Pry to remove.

Removal Tool for Ribbed-Shank Rivets— Easy-to-use hand tool minimizes panel damage when removing ribbed-shank rivets.

97576A500 ..... **Each** $27.64

Anchoring Adhesives for Concrete

Cartridge

Dual Cartridge

Applicator 7498A12

Applicators 7498A155 and 92378A160

Single-Use Polyester Pouch

Epoxy Syringe

Applicator 7622T23

Applicator 7497A16

Permanently set threaded rods, studs, and rebar into solid concrete, block, and brick. Adhesives form a weather-resistant chemical bond that seals out moisture and resists vibration and dynamic loads better than mechanical anchors. Use all adhesives in clean, drilled holes and let fully harden before applying any load. Color is gray. These products are compliant under all state VOC rules in effect as of June 1, 2011.

Threaded rod is sold separately below. For studs, see pages 3164-3175. For clean-out brushes, see 7221T on page 2707.

Quick-set acrylic adhesive sets the fastest and works well in low temperatures. It also hardens the fastest (higher temperatures reduce hardening time).

Epoxy adhesives work well for room temperature conditions and give you the most working time.

Bulk epoxy lets you mix as much as you need and does not require an applicator. *Note:* Not rated for pull-out strength.

Single-use polyester adhesive lets you open the pouch, mix, and dispense. No applicator needed. Not as strong as acrylic and epoxy.

Ultimate Pull-Out Strength, lbs. (in 4,000 psi Concrete)					
Threaded Rod Dia.	Install. Depth	Quick-Set Acrylic	Epoxy	Quick-Set Epoxy	Single-Use Polyester

Adhesive-Grip Internally Threaded Anchors for Concrete

Anchors are internally threaded for high pull-out strength in shallow concrete holes as well as where high vibration is present. Fill a clean, drilled hole half full with epoxy adhesive (sold separately on this page), then insert the anchor until it's flush with the surface. All have Class 2B thread fit. Ultimate pull-out strength is based on tests using epoxy adhesive in 3,000 psi concrete.

Type 316 stainless steel is more corrosion resistant than zinc-plated steel and may be mildly magnetic.

Warning! *Allowable pull-out strength is 25% of ultimate values or less, as req'd by building authorities.*

Stud Anchors for Concrete

Also known as wedge anchors, drive these into a hole, and tighten the nut to leave a threaded stud in concrete (nut and washer are included). They are not reusable. Ultimate shear strength is the force the side of an anchor can withstand before breaking. ***Stainless steel*** anchors are UL listed and FM approved. Type 316 is more corrosion resistant than 18-8. ***Galvanized steel*** anchors are more corrosion resistant than zinc-plated steel anchors. ***Zinc-plated steel*** anchors are ICC listed for use in cracked concrete, except 1/4″ dia. are ICC listed for uncracked concrete only. 3/8″ dia. anchors are FM approved. 1/2″ dia. anchors are UL listed and FM approved except for 2 3/4″ Lg. ***Grade 5 steel*** anchors have a Grade 5 steel body which is plated with zinc yellow-chromate and offers higher strength than zinc-plated steel and stainless steel. 3/8″ to 3/4″ dia. anchors are UL listed; 3/8″, 1/2″, and 3/4″ dia. are also FM approved.

Vibration-Resistant Stud Anchors for Concrete

The original wedge anchors—all have two locking wedges that keep fixtures solidly in place and won't shake loose. To install, insert the anchor into a hole and tighten the nut. Anchors are made of zinc-plated steel and include a washer and nut. All are class 2A thread fit. They are not reusable. Ultimate pull-out and shear strength are based on 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Stud Anchors for Concrete, Block, and Brick

Count on these anchors for secure, permanent holding power in a variety of applications. Also known as sleeve anchors, they provide a threaded stud when installed. Use them to hold steel, wood panels, doors, framing, and shelving to concrete. To install, drive the anchor into a hole, then tighten the bolt to expand the end. They are not removable. Ultimate pull-out and shear strength are based on 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Anchors with hex or acorn nut include a washer.

Anchors with removable flat head sit flush when installed. Unscrew the combination head to reveal the threaded stud.

Removable-Bolt Anchors for Concrete

Turn the bolt to expand the nut for a powerful friction grip. The bolt can then be removed and used in another hole along with a replacement nut. Also known as taper bolt anchors. To install, thread the nut on the tapered bolt and insert into a hole. Can also be used in stone. Bolts are Grade 5 zinc-plated steel; nuts are zinc alloy. Ultimate pull-out and shear strength are based on tests in 3,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Also Available: Replacement nuts, please ask for 92914A900 and specify anchor diameter.

Removable-Bolt Anchors for Concrete, Solid Block, and Brick

Hex Head

Flat Head

Also known as sleeve anchors, an expanding cone provides extra grip inside the hole. The bolt can be removed and reused in the same anchor hole. Anchors are stronger and more vibration resistant than stud anchors. To install, tap the anchor into a hole and tighten the bolt to expand the sleeve. As you tighten, the nylon ring compresses to secure the fixture against the base material. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking. Anchors are UL listed and FM approved.

Heavy Duty Screws for Concrete and Block

Serrated threads cut into masonry for easy insertion and holding strength along the entire length of the bolt. Install in a hole using a standard bit or a socket wrench. Anchors are zinc-plated steel and have a hex-washer head. Can be removed. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Screws for Concrete and Block

Hex-Washer Head Slotted

Flat Head Phillips

Installation Tools 90161A310

Drive these self-tapping screws into a hole with a hammer drill or socket wrench, or use one of the specialized tools (sold separately). Screws are removable.

Ultimate pull-out and shear strength are based on tests with minimum installation depth of 1″ in 3,000 psi concrete, except for 5/16″ dia. silver-coated steel, which is based on 3,500 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Hex-Washer Head Slotted Screws—Head width is 5/16″ for 1/4″ and 5/16″ dia. and 1/4″ for 3/16″ dia.

Flat Head Phillips Screws—Head width is 1/2″ for 1/4″ dia.; 3/8″ for 3/16″ dia.; and 9/16″ for 5/16″ dia.

Blue- and ***silver-coated*** screws can also be used in wood. They are made of hardened steel and resist 700 hours of salt spray. ***Blue-coated*** screws are also known as Tapcons.

Optional Installation Tools

For 3/16″ and 1/4″ Dia. Hex-Washer Head Slotted and Flat Head Phillips Screws—For screws of all lengths. Use with 3/8″ and 1/2″ hammer drills or SDS-Plus drive rotary hammer drills. Comes with a drill adapter, drive sleeve, two hex sockets, two Phillips bits with an adapter, a magnetic guide for steel hex head screws, and a hex key. Drill bits sold separately.

90161A110 ..... $55.11

For 1/4″ Dia. Hex-Washer Head Slotted Screws—For 1/4″ dia. hex-washer screws in 1 1/4″ and 1 3/4″ lengths. Use with 3/8″ and 1/2″ hammer drills. Includes a drive sleeve, 3/16″×3 1/2″ hammer drill bit, and a hex key. To use with SDS-Plus drive rotary hammer drills, order the SDS-Plus drill bit 90161A240 sold separately.

90161A310 ..... $31.36

For 5/16″ Dia. Hex-Washer Head Slotted and Flat Head Phillips Screws—For screws of all lengths. Use with 3/8″ and 1/2″ hammer drills or standard SDS-Max drive rotary hammer drills. Comes with a drill adapter, drive sleeve, Phillips bit, and a hex key. Drill bits sold separately.

90161A510 ..... $69.14

Installation Tool Kits with Screws

Kits contain 50 each of 1/4″×1″ and 1/4″×1 1/4″ hex-washer head slotted blue-coated steel screws and a drill bit. Come in a plastic case.

Kit for 3/8″ and 1/2″ Hammer Drills—Also includes a hex key.

90161A100 ..... $40.99

Kit for SDS-Plus Drive Rotary Hammer Drills—Also includes a drive sleeve.

90161A105 ..... $46.63

High-Strength Drive Anchors for Concrete

Anchors are one piece and compress when driven in, expanding inside a hole for a forceful grip. All have a round head. Can also be used in solid block. They are not reusable. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Type 316 stainless steel anchors offer excellent corrosion resistance. They may be mildly magnetic. ***Zinc-plated steel*** anchors are UL listed and FM approved.

Plastic Drive Anchors for Concrete

Also known as tap-in or uni-tap rivets, these anchors are barbed to resist pull out when fastening panels to concrete, hollow block, wood, and metal. To install, hammer into a hole that's slightly longer than the anchor.

Anchor diameter is 9/32″; head diameter is 5/8″; head height is 1/8″. Drill size is 1/4″ for masonry and 9/32″ for wood and metal. Anchors are white nylon. Temperature range is –20° to +160° F. Not removable or reusable. Ultimate pull-out strength is 150 lbs. Ultimate shear strength is 220 lbs. Strengths are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Heavy Duty Pin-Drive Anchors for Concrete and Solid Block

Stud Style

Tamper Resistant

Fasten panels with our strongest pin-drive anchors. To install, insert into a hole and hammer the pin to expand the end. When the pin is flush, the anchor is set. Not reusable. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Stud Style—Use to add a threaded stud above the surface. Can also be used in stone. Made of zinc yellow-chromate plated steel. Each anchor includes a hex nut with an integral washer and has a Class 2A thread fit.

Tamper Resistant—Can also be used in brick, mortar, stone, and wood. A reversible security nut threads on to prevent removal. Turn the nut round side up for a domed look or countersink the nut flat side up for a flush surface. Made of steel.

Pin-Drive Anchors

Domed Head

Domed Head and Removable Screw

Flat Head

Also known as drive rivets, the body flares out to hold securely. To install, hammer the pin or screw into the body. To remove *domed head* and *flat head* anchors, pry out the pin; for *domed head with removable screw*, unthread the screw. Anchors are not reusable or rated for pull out and shear strength.

Aluminum—For thin steel and wood.

Zinc—For concrete, block, and brick. FM approved.

Nylon—For concrete, block, brick, stone, steel panels, wood, and drywall. Vibration resistant. Install in a hole slightly deeper than the anchor is long. Temperature range is –40° to +185° F.

Warning! ***Allowable pull-out and shear strength are 25% of ultimate values or less, as req'd by building authorities.***

Internally Threaded Anchors for Concrete

Also known as drop-in anchors. Often used for overhead applications because the anchor's internal plug expands in four directions to hold it firmly inside the hole. To install, place the anchor into the hole, insert the required installation tool (sold separately on this page) into the anchor, and drive with a hammer until the thicker portion of the tool makes contact with the anchor. When installed, anchors sit flush with the surface.

UL listed and FM approved, except 97095A111. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking. Anchors have a Class 2B thread fit.

Type 316 stainless steel is more corrosion resistant than 18-8. It may be mildly magnetic.

18-8 stainless steel has excellent corrosion resistance and may be mildly magnetic.

Zinc-plated steel is coated for corrosion resistance.

Variable-Depth Internally Threaded Anchors for Concrete

Also known as recessed wedge anchors, these zinc-plated steel fasteners can be installed to any depth greater than the installation depth.

To install, thread a nut, washer, and an anchor onto the end of a threaded rod (nut, washer, and rod not included). Use a hammer to drive the entire assembly into a hole. When the washer and nut are flush with the hole, tighten to ensure secure contact.

Ultimate pull-out strength is based on tests in 3,000 psi concrete. Anchors have a Class 2A thread fit.

Internally Threaded Anchors for Concrete, Block, and Brick

All you need is a hammer—just tap into a drilled hole and position your fixture. Then insert a compatible threaded fastener (screw, rod, or lag screw not included) and tighten. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Standard expansion anchors provide a reliable grip. Also known as double expansion anchors, when installed, each half makes full contact against the wall of the hole. For maximum expansion, the anchor should protrude slightly above the surface before threading the screw. Anchors are zinc and have a Class 2B thread fit.

Vibration resistant expansion anchors use the force of an interior nut to expand in four directions. Sometimes called four-way expansion anchors, they can also be used in stone. Anchors are zinc and have a Class 2B thread fit.

Hollow material anchors hold fast in hollow base materials, but perform well in solid materials, too. Install cone end first. Cone is zinc-plated steel; sleeve is zinc. All have a Class 2B thread fit. 3/8″ to 5/8″ dia. anchors are UL listed and FM approved.

Lag screw anchors have a slight taper that prevents spinning. Install flush or slightly below the surface. Designed for use with lag screws (not included, see pages 3018-3019). Each diameter is available in two lengths. The shorter length reduces drilling time; the longer length provides more strength. Made of zinc.

Warning! ***Allowable pull-out and shear strength are 25% of ultimate values or less, as req'd by building authorities.***

Shallow Hole Internally Threaded Anchors for Concrete, Solid Block, and Brick

Shorter than other internally threaded anchors, these anchors hold on when there's not much material to hold. Also known as caulk-in and machine-bolt anchors, they consist of a lead sleeve around an internally threaded zinc cone. When installed, the cone expands the sleeve to hold it firmly inside the hole. To install, insert the anchor cone end first and use an installation tool (required, sold separately) to drive the sleeve over the cone. Then position your fixture, insert a screw or bolt (not included), and tighten. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking. Class 2B thread fit.

Standard Installation Tools— Use with a hammer to expand anchors. Made of zinc-plated steel.

Adjustable Shoulder Installation Tools— An adjustable shoulder acts as a stop so you can set your anchors at consistent depths. Use with a hammer. Made of hardened steel.

Quickset Installation Tools— The fastest and easiest way to install these anchors. Just insert the tip of the tool into the anchor and insert the cone end into the hole. Made of zinc-plated steel.

Light Duty Anchors for Concrete, Solid Block, and Brick

Conical

Finned

Flange Mount

Flush Mount

Tri-Lobe

Also known as plug anchors, use these anchors for light duty mounting in concrete, solid block, brick, and other materials as noted below. To install, drill a hole slightly deeper than the anchor is long and insert the anchor until it's flush with the surface. Next, thread a screw through your fixture and into the anchor, and tighten. To determine screw length, add the anchor length to the fixture thickness and choose a screw longer than this. For sheet metal screws, see pages 3022-3030; for wood screws, see pages 3014-3021. Not rated for shear strength.

Conical— Anchors expand and distort during screw installation to provide a high strength connection point. They're rustproof and can also be used in hollow block. Ultimate pull-out strength is based on tests in 4,000 psi concrete.

Finned— Large fins prevent rotation. Also called mungo anchors, these reliable anchors can also be used in hollow block and stone. Temperature range is –104° to +176° F. Ultimate pull-out strength is based on tests in solid brick.

Flange Mount and ***Flush Mount—*** All-purpose anchors split in half when a screw is inserted. They can also be used in hollow block and stone. Temperature range is –20° to +212° F. Ultimate pull-out strength is based on tests in 3,500 psi concrete.

Tri-Lobe— The lobed shape prevents twisting. Temperature range is 0° to 120° F. Ultimate pull-out strength is based on tests in 2,000 psi concrete.

Anchors for Drywall

Tackle all kinds of light duty fastening with these plug-style anchors. Install anchors flush with the surface. Then, thread a screw through your fixture, into the anchor, and tighten. To determine screw length for all except self-drilling anchors, add the anchor length to the fixture thickness and choose a screw equal to or longer than this. For self-drilling anchors, choose a screw equal to or shorter than this. Not rated for shear strength.

Self Drilling— Use with sheet metal screws at least 1¼″ long. Ultimate pull-out strength is 30 lbs. based on tests in ⅜″ thick drywall. Temperature range for nylon is 30° to 170° F.

Conical— Can also be used in plaster and wood paneling. They have a ridged body with fins that prevent spinning during installation. Temperature range is 30° to 150° F. Pull-out strength is not rated.

Twist-Action— The twist-action creates a knot behind hollow materials, which holds the anchor in place. Also called polysets, they can also be used in wood. Temperature range is 14° to 120° F. Ultimate pull-out strength is 110 lbs. based on tests in ½″ drywall.

Twist-Action Finned— Fins prevent anchors from spinning during installation. The twist-action creates a knot behind hollow materials, which holds the anchor in place. Temperature range is –104° to +176° F. Not rated for pull-out strength.

Toggle— Vibration resistant. Fins on the shaft prevent spinning during installation. Can also be used in plywood and paneling. Temperature range is –20° to +212° F. Ultimate pull-out strength is 120 lbs. based on the maximum wall thickness listed.

Hammer In— Easy to install; just tap in like a nail. When you thread in a screw the anchor bends to hold against the wall. Not rated for temperature. Ultimate pull-out strength is 80 lbs. based on tests in ½″ thick drywall.

Reusable Hammer-In and ***Reusable Drill-In Anchors—*** Also called hollow wall and molly anchors. Once installed, the screw can be removed repeatedly without affecting the anchor. To install, tap the anchor into the base material, then turn the screw to expand it. Two prongs under the flange prevent the anchors from turning inside the hole. *Reusable drill-in* anchors require a drilled hole for installation; *reusable hammer-in* anchors do not. Can also be used in plaster and plywood. Ultimate pull-out strength is 80 lbs. based on tests in ⅜″ drywall. For high volume tasks, take advantage of our optional installation tool—it doesn't require any twisting.

Anchors—For screws, see pages 3014-3030.

90228A211 ..... $96.69

Self-Drilling Toggle Bolts

Save time using a toggle bolt that drills its own hole in ⅜″-⅝″ thick drywall. To install, simply drive the toggle bolt into the wall, then position your fixture and the included steel screw over it. The toggle is drawn against the wall as you tighten the screw. Ultimate pull-out strength is based on tests in ½″ drywall.

Warning! ***Allowable pull-out and shear strength are 25% of ultimate values or less, as req'd by building authorities.***

Toggle Bolts

Toggle bolts use a spring-loaded, wing-like toggle (included) to hold against the back of hollow base materials. To install, insert the bolt through your fixture and thread the toggle onto it. Next, fold the toggle wings flush against the bolt and push them through a drilled hole until they pop open on the other side. Pull back on the bolt and tighten. The bolt is reusable, but the toggle will fall behind the wall when the bolt is removed. Extra toggles sold separately.

Round head toggle bolts have a slotted/Phillips combination drive; *flat head* have a slotted drive. *Low profile* are also known as binding head toggle bolts. Bolts and toggles are zinc-plated steel. Bolts have a Class 2A thread fit; toggles have a Class 2B. Ultimate pull-out and shear strength are based on tests in ½″ drywall. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

97121A600 ..... $108.50

Stud and Internally Threaded Toggle Anchors

Add a threaded stud or socket connection point. A pivoting toggle bar holds tight against hollow base materials. To install, push through a drilled hole; gravity drops the toggle into position. Anchors are made of zinc yellow-chromate plated steel and are removable. Ultimate pull-out and shear strength are based on tests in 1,500 psi concrete block. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Stud Style—Furnished with a nut and washer. Class 2A thread fit.

Internally Threaded Style—Provides an internally threaded socket connection for a threaded rod (not included). Class 2B thread fit. Not rated for shear strength.

Never-Drop Toggle Anchors

Stop replacing anchors every time you change a fixture. When you unthread the screw, these anchors stay put. To install, push the toggle through a drilled hole and pull the anchor back toward you until the toggle rests flush against the wall. Then slide the cap up to the wall and snap off the straps. Next, position your fixture, insert a machine screw (not included), and tighten. Minimum screw length equals wall and fixture thicknesses plus ½″.

Anchor body is plastic. Class 2B thread fit. Ultimate pull-out and shear strengths are based on tests in concrete block. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Warning! ***Allowable pull-out and shear strength are 25% of ultimate values or less, as req'd by building authorities.***

About Spring Pins

Because spring pins are larger than the hole into which they're installed, tension against the hole wall holds them in place.

Slotted Spring Pins

End View

Slotted spring pins are also known as roll, tension, split, and expansion pins. Because the slot is pressed closed when the pins are inserted, they don't flex after installation.

Coiled Spring Pins

End View

Coiled spring pins are flexible after installation so they absorb shock and vibration better than slotted spring pins. They also have higher dynamic load capacities and accommodate wider hole tolerances.

For technical drawings and 3-D models, go to mcmaster.com.

Slotted Spring Pins

Use these versatile pins for fastening, pivoting, and holding. Ends are beveled or rounded to aid insertion. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. Wall thickness is approx. 20% of the diameter. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Meet ASME B18.8.2.

***18-8 Stainless Steel*—**The most corrosion resistant. May be mildly magnetic. Not rated for hardness.

***Type 420 Stainless Steel*—**Stronger than 18-8 stainless steel and more corrosion resistant than steel. It is magnetic. Minimum Rockwell hardness is C43.

Zinc-Plated Steel and ***Steel*—**Stronger than 18-8 stainless steel and just as strong as Type 420 stainless steel. Zinc-plated steel is more rust resistant than steel. Minimum Rockwell hardness is C43.

For information about spring pins, see page 3323.

Metric Slotted Spring Pins

Often used for fastening, pivoting, and holding. To aid insertion, M1 to M8 diameter pins are beveled on both ends; M10 and M12 diameter pins have at least one beveled end. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. Wall thickness is approx. 20% of the diameter. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. All meet ISO 8752 (similar to DIN 1481).

18-8 Stainless Steel— More corrosion resistant than steel. May be mildly magnetic. Not rated for hardness or breaking strength.

Steel— Heat treated and stronger than 18-8 stainless steel. Minimum Rockwell hardness is C42.

Pin Insertion Tools with Sleeve-Style Pin Holder

To install spring, dowel, and taper pins, slide the sleeve over the pin and strike the head of the tool with a hammer. O-rings hold the pin securely in the tool. Can also be used for pin removal and disassembly.

5-piece assortment includes one of each tool listed. Comes in a plastic case.

Mil. Spec. Slotted Spring Pins

Pins meet more stringent specifications (MS16562) than standard slotted spring pins. Use to fasten, pivot, and hold a variety of materials. Ends are beveled or rounded to aid insertion. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. Wall thickness is approx. 20% of the diameter. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces.

Black Steel—Stronger than 400 series stainless steel. Finish is black phosphate. Min. Rockwell hardness is C46.

400 Series Stainless Steel—More corrosion resistant than black steel. Pins are passivated. Min. Rockwell hardness is C43.

Black Steel

●Length range for M3 diameter is 10-30 mm.

Pin Insertion Tools with Magnetic Pin Holder

A magnetic tip holds on to pins making this tool especially handy for angles and hard to reach areas. Use it to install and remove magnetic spring, dowel, and taper pins. Strike the head of the tool with a hammer to insert pins; a spring retracts the tool after insertion.

For Pin Dia.	Lg.		
1/16"	5 1/2"	91625A110	$58.04
3/32" (M2.5)	5 3/4"	91625A130	58.04
1/8" (M3)	6"	91625A140	58.04
5/32" (M4)	8 1/2"	91625A150	$68.46
3/16" (M5)	9"	91625A160	63.57
1/4" (M6)	10"	91625A180	63.57

For information about spring pins, see page 3323.

Coiled Spring Pins

After installation, pins remain flexible so they absorb shock and vibration better than slotted spring pins. Ends are beveled or rounded to aid insertion. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. All meet ASME B18.8.2.

18-8 Stainless Steel—More corrosion resistant than Type 420 stainless steel. It may be mildly magnetic. Not rated for hardness.

Type 420 Stainless Steel—Stronger than 18-8 stainless steel and more corrosion resistant than steel. Minimum Rockwell hardness is C46.

Steel—Stronger than 18-8 stainless steel and just as strong as Type 420 stainless steel. Minimum Rockwell hardness is C42. Pins are heat treated.

Extra strength pins are thicker, making them roughly 30% stronger than their standard counterparts.

1,000-Piece Assortment				
Steel	1/16″-5/16″	1/4″-3½″	91598A645	138.14

Metric Coiled Spring Pins

Pins remain flexible after installation so they absorb shock and vibration better than slotted spring pins. Ends are beveled or rounded to aid insertion. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. For the best fit, your hole should be equal to or slightly greater than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Meet ISO 8750.

18-8 Stainless Steel—More corrosion resistant than steel. May be mildly magnetic. Not rated for hardness.

Steel—Stronger than 18-8 stainless steel. Minimum Rockwell hardness is C43.
